ABSTRACT
Sense of well-being or life satisfaction is one of the most important features that a qualified mental health should be enjoyed. Sustainable and inclusive concept of life satisfaction is the general feeling of the community towards a world in which people live reflect and Individual and social aspects of the case so as to find out. So in addition to individual factors influencing satisfaction, social factors are also examined, including the amount of social capital. This study examined the relationship between social capital and life satisfaction among young people, is in Hamedan. In this regard, this study seeks to answer this question are the various dimensions of social capital and life satisfaction, what relationship there? In the present research, surveys and data collection, Questionnaire is a multistage sampling, using a random sample of 380 young people has been studied in Hamadan. Such variables as independent variables were examined in this study including; social trust, social integration, social participation. The total amount of social capital, socio-economic, age. Thus the effect of each of these variables were assessed on Life satisfaction to show that is there any correlation between these variables and Life satisfaction of the citizens or not. The findings suggest that there is a significant relationship between independent and dependent variables investigated.

Introduction
Nowadays, in addition to human, economic and physical capital, social capital is another name that has been considered in economic and social surveys. Social capital like concepts such as physical and human capital (the tools and trainings that enhance individual productivity), refers to the social organization features such as networks, norms and trust which facilitate the coordination and cooperation to achieve mutual benefit. Social capital increases investment gains in physical capital and human capital. Always it is easier to corporate in a society in which social capital is remarkable. Todays it is impossible without social capital to reach to development, civil society, the universe criteria and suitable ground for social life, (Shaare Pour and Hosseini, 2008). Social capital is a term that is normally used everyday, even though the image of its concept is often too little. The social capital is an old concept, but is the only term that is recently well developed (Bankston and Zhou, 2002, Labonte, 1999).

Until the recent decades, economic scholars considered growth and development of a country depending on natural resources. Then, during the last half century with the emergence of neoclassists, human capital formation was also considered, but social interactions and the role of values and culture and in general, formal and informal institutions in the economy was fewer considered.

With the emergence of the school “new institutionalism”, was paid more attention to the role of institutions and particularly, social capital in development of a country. This type of investment is defined by the World Bank as “invisible assets”. If the social interaction, in which culture, customs, norms, institutions, and social networks are involved in its formation, are grown and evolved in a positive direction, can reduce transaction costs and impact on other types of capital in economic interactions and exchanges and finally can impact on the country's growth (safdari and others, 2008: 39).

In this context, social capital has become a very common concept and slogan among politicians and academic elites. Social capital is a multi-dimensional concept in the social sciences and influential in many areas of society, and therefore it is important to take into consideration and review.

Theoretical Framework
Social capital is a term that is normally used everyday, even though the image of its concept is often too little. The social capital is an old concept, but is the only term that is recently well developed (Bankston and Zhou, 2002, Labonte, 1999).

The term social capital is said to capitals such as trust, norms and networks that people can draw for a general solution (Adam and Roncevic, 2003). The existence of social capital is used as a solution to different social problems such as poverty, crime, underdeveloped economy and inefficient government. (Boix and Posner,1998).

Social capital is linked to concepts such as, civil society and social relationships (adam and roncevic, 2003).

Although the origins of social capital discussion can be found in the work of nineteenth-century sociologists as Durkheim, Weber, Marx and Simmel (Grix, 2001 Wall et al 1998 Portes et
James Coleman put social capital in the anchors cooperation in the social structures. Coleman looks at social capital as conglomeration of relations among and within the anchors cooperation in a society which has a benefit to some of population and has not to some others. Social capital is not a singular unit but it is a range of different units which has two parameters in common: all of them include aspects of a social structure and help to a specific anchor which are in the structure. Development of social capital is said to the aspects of trustworthiness, obligations, and influencial norms which are kept by the participants in the network and depends on the opportunities and resources in progress. Coleman considers the formation and destruction of social capital and its effects on closing the relationships within the chain groups.

He also assessed the aspects of social structures in different ideologies and the role of government in the development of social capital. Coleman's definition of social capital is still more perfect than the recent sociological research, although it has been revised by the researchers (Barber et al., 1389: 25).

Putnam claims that participation in society such as formal and informal networks of social, is the main centre of social capital concept (Putnam, 2000: 56). He says that the voluntary cooperation is better done in a society that has inherited a enormous social capital in the form of social reciprocity norms and social cooperative networks (Putnam, 2000: 138). Social networks encourage people more to track collaboration and reliability than individual conditions of self-interest (Tajbakhsh, 2004: 12). Unlike economic capital, social capital is a public good. Perhaps that is why it is often considered less valuable and will not take much effort to improve it. Putnam's social capital indexes are trust, norms and social cooperative networks that by facilitating social interaction improve the social efficiency.

A) Trust: trust facilitates collaboration among people and cooperation also creates confidence. Confidence requires predicting the behavior of an independent actor. In small and integrated communities the prediction is based on "sincere faith", it means the trust that depends on people close familiarization, but in larger communities requires a more impersonal trust. These communities trust rely on two relevant sources: norms and social cooperative networks (Shaditalab and Hodjati-e- Kirmani, 2008: 37).

B) social norms: social norms transfer the controlling operation of an agent to others. norms are taught through socialization and as well as encouragement and sanctions to the population. In many societies, strong norms and social cooperative networks minimize the risk of abjuration to the least. Threat to the economic and social disenfranchisement is a powerful and reliable norm in society. In communities where people can be assured that trust is not abused, they are more likely to interact.

C) social cooperative networks: each community is known through formal and informal channels of communication between individuals. Some of these networks have the same level (horizontal) and citizens of equal status and power are together. But others are vertical networks associating citizens hierarchically based on unequal relations. In most cases, networks are a combination of vertical and horizontal relationships. As the social networks are more dense in population, there is more likelihood that citizens will cooperate for mutual benefit. An example of the equal cooperation bonds (horizontal) is kinship which has a special role in solving social problems, but in the social level, strengthen the cooperation networks of kinship is less than the networks of civic engagement (common registration in communities). Social cooperatives networks which turns around the civic engagement gap causes a broader cooperation, thus different social networks has a vast part of social capital accumulation of a society. mutual relationship among social capital resources such as trust, norms and cooperative networks that encourage and increase, are the characteristics of civil society. The absence of these features: abjuration, mistrust, exploitation, isolation and disorder encourages each other to vicious cycle of under-development periods (ibid).

In the 1970s and 1980s, Bourdieu developed the concept of social capital, but this parts of his work received less attention than his social theories (Field, 2003). One of the fundation stones of Bourdieu's sociological theory is consideration of society as a plurality of social field. Capital forms (economic, cultural and social) are essential factors which define the location and facilities of various actors in any field (Siisaman, 2000). To him, capitalism is emerged in three fundamental forms: economic capitalism which can be turned into money, and it is possible to be institutionalized in the form of ownership; in form of social capital which is made of social requirement and in certain circumstances has the potential to become the economic capital and may be institutionalized in the form of an aristocracy or nobility (Majedi and Lahsaee zadeh, 2006: 94). He believed that social capital is one of the leading social science research, these social principles is to strengthen individuals and groups (Bourdieu, 1980: 45) According to Bourdieu, social capital has two components: the first is associated with group membership and social networks, and the second is the volume of social capital possessed by a human agent and is based on the size of communication networks that he can mobilize.

Bourdieu believes that the quality is resulted by the overall communication among the actors than a typical quality group in itself.

Joining the groups and involving in social networks, which is resulted in the group and social relations obtained from membership can be used to improve the social status of actors in different areas. Voluntary associations, trade unions, political parties and series associations are all examples of new social capital (ibid.).

Decker consideres social capital as active networks. social capital is as treatment of disjointed results of social disintegration and disappearance of integration they are expected to arise cooperation, welfare and economic growth, which is a result of social democratic processes which are considered simultaneously. This implies the potentials to develop social skills and attitudes. Social capital appears to be
the overall solution to many detrimental aspects of developed democratic societies. Decker and Avslanr also believe that social capital can clear unforeseen anomalies of general rational theory within social cooperation and solidarity (Qalibaf, 2008: 30).

Granovetter, founder of the weak ties theory believes that social capital can be assessed in terms of intensity, frequency, and the inclusion of different types such as relationships, friends, colleagues and .... The intensity and strength of social ties within a group causes weakening its relationships with outside groups. Granovetter believed that cohesive relations among members of group members have led to weak ties in outside groups and reduces social capital, so the weak link in the group leads to build relationships with individuals and groups in outside and to the creation of social capital (Alvani, 2006: 8).

The theory of social capital impact on life satisfaction (theoretical framework)

One of those in more detail the relationship between social capital and life satisfaction has been shown to Uphoff. Defines a point Uphoff External and visible and invisible underside of structural social capital and cognitive social capital. But he does emphasize that these two domains are connected to each other in practice, he will discuss how the social science theory of the phenomenon of both are linked together and behavioral subjective a such expectations. Formal or informal organizations, roles, rules, practices, and procedures, formal or informal networks of parallel interactions, as well as the norms, values, attitudes and beliefs that are shared by a population can be obtained Effects give force and power (Uphoff, 2000).

Uphoff The concept of social capital, social capital is consistent with the ideas of Coleman and Pantam knows he looked such a constructive factor of social capital by organizing two major categories - which can make it more accurate and to prepare for studying - and it is more appropriate formulation of the concept of social capital is such that measure and evaluate progress and theoretical work would be more appropriate. Uphoff says these two categories of high levels of social capital are interdependent, such that each of the forms (structural or cognitive) to help each other, they are both provided through experience, or culture and spirit of and other factors they thought a boost. Uphoff says that the higher forms of cognitive and structural social capital, resulting in improved quality of life and life satisfaction is (Uphoff, 2000).

Hypothesis

1- Correlation between social trust and satisfaction of the people living there.
2- Correlation between social integration and satisfaction of the people living there.
3- Correlation between social participation and satisfaction of the people living there.
4- Correlation between the total amount of social capital and life satisfaction there.
5- Significant relationship between socio-economic base and life satisfaction of young people there.
6- Significant association between age and life satisfaction of young people there.

Research Method

The present research is a quantitative research, uses field method and has been conducted by using survey technique.

The present study was undertaken by using quantitative approach and the research method used field method; documentary techniques have been also used in preliminary studies. The research technique is survey, of course library studies technique has been also used.

Data collection is carried out by using the researcher made questionnaire. Statistical population of all city youth 15 to 29 years are based on a sample size of 380 individuals were selected by multistage cluster sampling.

In this study, face validity was used for validation, so that the questionnaire items were examined by several professors of sociology and the revised points were included in the questionnaire. Cronbach's alpha coefficient was used to assess the reliability. Regarding to high Cronbach's alpha coefficient, all the variables were approved at the final/7 for the reliability of the questionnaire.
is a significant relationship between Social integration with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

**Hypothesis three: Correlation between social participation and satisfaction of the people living there.**

To investigate the relationship between these two variables, the Pearson correlation coefficient is used. The findings are summarized as follows:

\[ H_0: \rho = 0 \]
\[ H_1: \rho \neq 0 \]

Table 3. Pearson correlation results of the three hypothesis

<table>
<thead>
<tr>
<th>social participation</th>
<th>( r )</th>
<th>Life satisfaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>.341</td>
<td></td>
<td></td>
</tr>
<tr>
<td>.000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>380</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The results show that because the correlation coefficient values \( r = .341 \) at a significance level \( \alpha = .05 \) is significant, therefore, the null hypothesis is rejected and the research hypothesis is confirmed with confidence level of 95%. So there is a significant relationship between social participation with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

**Hypothesis four: Correlation between the amount of social capital and life satisfaction there.**

Table 4. Pearson correlation results of the three hypothesis

<table>
<thead>
<tr>
<th>The total amount of social capital</th>
<th>( r )</th>
<th>Life satisfaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>.446</td>
<td></td>
<td></td>
</tr>
<tr>
<td>.000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>380</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The results show that because the correlation coefficient values \( r = .446 \) at a significance level \( \alpha = .05 \) is significant, therefore, the null hypothesis is rejected and the research hypothesis is confirmed with confidence level of 95%. So there is a significant relationship between The total amount of social capital with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

**Hypothesis five: Significant relationship between socio-economic base and life satisfaction of young people there.**

Since the socio-economic are interval variables, the Pearson's correlation coefficient was used to test this hypothesis.

\[ H_0: \rho = 0 \]
\[ H_1: \rho \neq 0 \]

Table 5. Pearson correlation results of the Four hypothesis

<table>
<thead>
<tr>
<th>socio-economic base</th>
<th>( r )</th>
<th>Life satisfaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>.591</td>
<td></td>
<td></td>
</tr>
<tr>
<td>.000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>380</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The results show that because the correlation coefficient values \( r = .591 \) at a significance level \( \alpha = .05 \) is significant, therefore, the null hypothesis is rejected and the research hypothesis is confirmed with confidence level of 95%. So there is a significant relationship between socio-economic base with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

**Hypothesis six: Significant association between age and life satisfaction of young people there.**

To investigate the relationship between these two variables, the Pearson correlation coefficient is used. The findings are summarized as follows:

\[ H_0: \rho = 0 \]
\[ H_1: \rho \neq 0 \]

Table 6. Pearson correlation results of the five hypothesis

<table>
<thead>
<tr>
<th>age</th>
<th>( r )</th>
<th>Life satisfaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>.267</td>
<td></td>
<td></td>
</tr>
<tr>
<td>.000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>380</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The results show that because the correlation coefficient values \( r = .267 \) at a significance level \( \alpha = .05 \) is significant, therefore, the null hypothesis is rejected and the research hypothesis is confirmed with confidence level of 95%. So there is a significant relationship between age with Life satisfaction, and the relationship is positive and direct. The relationship is average.

**Conclusion**

As mentioned Sense of well-being or life satisfaction is one of the most important features that a qualified mental health should be enjoyed. Sustainable and inclusive concept of life satisfaction is the general feeling of the community towards a world in which people live reflect and Individual and social aspects of the case so as to find out. So in addition to individual factors influencing satisfaction, social factors are also examined, including the amount of social capital.

In this study, we sought to examine the relationship between different dimensions of social capital and life satisfaction survey techniques are young people in Hamadan field method and the. Such variables as independent variables were examined in this study including; social trust, social integration, social participation, The total amount of social capital, socio-economic, age. Thus the effect of each of these variables were assessed on Life satisfaction to show that is there any correlation between these variables and Life satisfaction of the citizens or not.

The overall results show that:

So there is a significant relationship between Social trust with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

there is a significant relationship between Social integration with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

there is a significant relationship between social participation with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

there is a significant relationship between social participation with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

there is a significant relationship between socio-economic base with Life satisfaction, and the relationship is positive and direct. The relationship is Average.

there is a significant relationship between age with Life satisfaction, and the relationship is positive and direct. The relationship is average.
