Metric convexity,
Meir and Keeler type condition.

#### Abstract

The aim of this paper is to establish a fixed point theorem for non-self mappings by using the Meir and Keeler $(\varepsilon, \delta)$ type contraction condition. Our result generalizes completely or partially the result due to Meir and Keeler [5], Rhoades [10] and others.

## Introduction

In 1969, Meir and Keeler [5] proved that Banach Contraction Principle remains true for weakly uniformly strict contractions: Given $\varepsilon>0$ there exists a $\delta>0$ such that

$$
\varepsilon<\mathrm{d}(\mathrm{x}, \mathrm{y})<\varepsilon+\delta \text { implies } \mathrm{d}(\mathrm{Tx}, \mathrm{Ty})<\varepsilon .
$$

The result due to Meir and Keeler [5] has been generalized and extended in various ways and there exists a considerable literature for self mappings. To mention a few, we cite [3,5,6,7,8,9].

In this paper, we prove a Meir and Keeler [5] type fixed point theorem for single-valued non-self mappings in metrically convex spaces by using the ideas of Rhoades [10]. In proving the result, we follow the definitions and conventions of Assad [1] and Assad and Kirk [2]. Before formulating our result, for the sake of completeness, we state the following result due to Rhoades [10].
Theorem 1.1. ([10]) Let ( $X, d$ ) be a complete metrically convex metric space and $K$ be a nonempty closed convex subset of $X$. Let $\mathrm{T}: \mathrm{K} \rightarrow \mathrm{X}$ be a mapping satisfying:

$$
\mathrm{d}(\mathrm{~T} x, \mathrm{~T} y) \leq \mathrm{M}(\mathrm{x}, \mathrm{y})
$$

where $M(x, y)=\max \{1 / 2 d(x, y), d(x, T x), d(y, T y), d(x, T y)+d(y, T x)\}$
for all $\mathrm{x}, \mathrm{y} \in \mathrm{K}$, with $\mathrm{x} \neq \mathrm{y}$, where $0<\mathrm{h}<1, \mathrm{q} \geq 1+2 \mathrm{~h}$ and $\mathrm{T} \mathrm{x} \in \mathrm{K}$ for each $\mathrm{x} \in \delta \mathrm{K}$. Then T has a fixed point in K .

## Definition 1.2.

Let K be a nonempty subset of a metric space X and the mapping $\mathrm{T}: \mathrm{K} \rightarrow \mathrm{X}$ is said to be $(\epsilon, \delta)$ contraction if there exists a function $\delta:(0, \infty) \rightarrow(0, \infty)$ such that, for any $\epsilon>0, \delta(\epsilon)>\epsilon$ and

$$
\begin{equation*}
\epsilon \leq M(x, y)=\max \left\{d(x, y), d(x, T x), d(y, T y), \frac{d(x, T y)+d(y, T x)\}}{2}<\epsilon(\delta)\right. \tag{1.1}
\end{equation*}
$$

which implies that $\mathrm{d}(\mathrm{Tx}, \mathrm{Ty})<\epsilon$.
Definition 1.3. ([2])
A metric space $(X, d)$ is said to be metrically convex if for any $x, y \in X$ with $x \neq y$ there exists a point $z \in X, x \neq z \neq y$ such that

$$
\mathrm{d}(\mathrm{x}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{y})=\mathrm{d}(\mathrm{x}, \mathrm{y}) .
$$

Lemma 1.4. ([2])
Let $K$ be a nonempty closed subset of a metrically convex metric space $X$. If $x \in K$ and $y \notin K$ then there exists a point $z \in \delta K$ (the boundary of $K$ ) such that

$$
\mathrm{d}(\mathrm{x}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{y})=\mathrm{d}(\mathrm{x}, \mathrm{y})
$$

## 2. Result

The main result runs as follows.

## Theorem 2.1.

Let ( $\mathrm{X}, \mathrm{d}$ ) be a complete metrically convex metric space and K be a nonempty closed subset of X . The mapping $\mathrm{T}: \mathrm{K} \rightarrow \mathrm{X}$ satisfying (1.1) and
(i) for each $\mathrm{x} \in \mathrm{K}, \mathrm{T} \mathrm{x} \in \mathrm{K}$.

Then T has a unique fixed point in K .

## Proof

Firstly, we proceed to construct two sequences $\left\{x_{n}\right\}$ and $\left\{y_{n}\right\}$ in the following way. Let $x_{0} \in K$. Define $y_{1}=T x_{0}$. If $y_{1} \in K$ set $y_{1}=x_{1}$. If $y_{1} \notin K$, then choose $x_{1} \in \delta K$ so that

$$
\mathrm{d}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right)+\mathrm{d}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)=\mathrm{d}\left(\mathrm{x}_{0}, \mathrm{y}_{1}\right) .
$$

If $y_{2} \in K$ then set $y_{2}=x_{2}$. If $y_{2} \notin K$, then choose $x_{2} \in \delta K$ so that

$$
\mathrm{d}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)+\mathrm{d}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)=\mathrm{d}\left(\mathrm{x}_{1}, \mathrm{y}_{2}\right) .
$$

Thus, repeating the foregoing arguments, one obtains two sequences $\left\{\mathrm{x}_{\mathrm{n}}\right\}$ and $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ such that
(ii) $\mathrm{y}_{\mathrm{n}+1}=\mathrm{T} \mathrm{x}_{\mathrm{n}}$,
(iii) $y_{n}=x_{n}$ if $y_{n} \in K$,
(iv) if $x_{n} \in \delta K$ then $d\left(x_{n-1}, x_{n}\right)+d\left(x_{n}, y_{n}\right)=d\left(x_{n-1}, y_{n}\right)$, where $y_{n} \notin K$.

Here, one obtains two types of sets we denote as follows:

$$
P=\left\{x_{i} \in\left\{x_{n}\right\}: x_{i}=y_{i}\right\} \text { and } Q=\left\{x_{i} \in\left\{x_{n}\right\}: x_{i} \neq y_{i}\right\}
$$

One can note that, if $x_{n} \in Q$ then $x_{n-1}$ and $x_{n+1} \in P$. We wish to estimate $d\left(x_{n}, x_{n+1}\right)$. Now, we distinguish the following three cases.
Case 1. If $\left(x_{n}, x_{n+1}\right) \in P$, then $d\left(x_{n}, x_{n+1}\right)=d\left(T x_{n-1}, T x_{n}\right) \leq M\left(x_{n-1}, x_{n}\right)$

$$
\left.\begin{array}{l}
\leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{~T} \mathrm{x}_{\mathrm{n}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{~T} \mathrm{x}_{\mathrm{n}}\right), \frac{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{~T} \mathrm{x}_{\mathrm{n}}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{~T} \mathrm{x}_{\mathrm{n}-1}\right)}{2}\right\} \\
\leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1,} \mathrm{x}_{\mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}}\right)\right. \\
\end{array}\right\}
$$

If we suppose that $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right)$, then we get $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right)$, which is a contradiction.
Otherwise, if $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right)$ then, one obtains
$\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{M}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right)$.
Case 2. If $x_{n} \in P$ and $x_{n+1} \in Q$, then

$$
\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}+1}, \mathrm{y}_{\mathrm{n}+1}\right)=\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+1}\right)
$$

which in turn yields $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+1}\right)$. Now, proceeding as Case 1, we have

$$
\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{M}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) .
$$

Case 3. If $x_{n} \in Q$ and $x_{n+1} \in P$. Since $x_{n} \in Q$ and is a convex linear combination of $x_{n-1}$ and $y_{n}$, it follows that $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}+1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}+1}, \mathrm{y}_{\mathrm{n}}\right)\right\}$.
Now, if $\quad d\left(x_{n-1}, x_{n+1}\right) \leq d\left(y_{n}, x_{n+1}\right)$, then $d\left(x_{n}, x_{n+1}\right) \leq d\left(y_{n}, x_{n+1}\right)=d\left(x_{n}, x_{n+1}\right)$.
Proceeding as above, one gets $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{M}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right)$.
Next, if $d\left(y_{n}, x_{n+1}\right) \leq d\left(x_{n-1}, x_{n+1}\right)$, then

$$
\begin{aligned}
& \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}+1}\right)=\mathrm{d}\left(\mathrm{~T}_{\mathrm{n}-2}, \mathrm{~T}_{\mathrm{x}}\right)=\mathrm{M}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}}\right) \\
& \leq \max \left\{d\left(x_{n-2}, x_{n}\right), d\left(x_{n-2}, T x_{n-2}\right), d\left(x_{n}, T x_{n}\right), d\left(x_{n-2}, T x_{n}\right)+d\left(x_{n}, T x_{n-2}\right)\right\} \\
& \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right), \underline{\left.\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\underline{n}}, \mathrm{x}_{\underline{n}-1}\right)\right\} .}\right.
\end{aligned}
$$

Here, three cases are possible, either $d\left(x_{n-2}, x_{n}\right), d\left(x_{n-2}, x_{n-1}\right)$ or $\left.\frac{d\left(x_{n-2}\right.}{\underline{n}} \frac{x_{n+1}}{} \frac{)+d\left(x_{\underline{n}}\right.}{2}, x_{\underline{n}-1}\right)$
will be maximum.
Firstly, we choose $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}}\right)$ as maximum then
$\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right)\right\}$.
When $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)$ is maximum then $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)$, otherwise

$$
\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right)
$$

Secondly, we choose $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)$ as maximum then $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)$.
Finally, if $\left.\underline{d\left(x_{n-2}, x_{n+1}\right.} \frac{)+d\left(x_{n}, x_{n-1}\right)}{2}\right)$ is maximum, then

$$
\begin{aligned}
& \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq 1 \frac{\left\{\mathrm{~d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}-1}\right)\right\}}{2} \\
& \leq 1 \frac{\left.1 \mathrm{~d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2} \mathrm{x}_{\mathrm{n}-1}\right)\right\} \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}-1}\right)\right\} .}{2} .
\end{aligned}
$$

Thus in all the cases, we have

$$
\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)\right\} .
$$

## Hence

$\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \mathrm{M}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right) \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}-2}, \mathrm{x}_{\mathrm{n}-1}\right)\right\}$.
It can be easily shown by induction that for $\mathrm{n}>1$, we have
$\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right), \mathrm{d}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)\right\}$.
Thus $d\left(x_{n}, x_{n+1}\right)$ is decreasing and tending to 0 as $n \rightarrow \infty$. Hence $d\left(x_{n}, x_{n+1}\right)$ converges to $t \in[0, \infty)$. If $t=0$ then conclusion is trivial. So, suppose that $t>0$. Since $d\left(x_{n}, x_{n+1}\right)$ converges to $t$, the condition (1.1) yields

$$
\mathrm{t} \leq \mathrm{M}\left(\mathrm{x}_{\mathrm{n}-1}, \mathrm{x}_{\mathrm{n}}\right)<\delta(\mathrm{t}) .
$$

Therefore $\mathrm{d}\left(\mathrm{Tx}_{\mathrm{n}-1}, \mathrm{~T} \mathrm{x}_{\mathrm{n}}\right)=\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right)<\mathrm{t}$, this contradicts the fact. Thus

$$
\begin{equation*}
\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right) \rightarrow 0 \text { as } \mathrm{n} \rightarrow \infty \tag{2.2}
\end{equation*}
$$

Now, we show that for every $\epsilon>0$ there exists $m, n \geq N$ such that $\leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}-1}\right)<\delta(\epsilon) \Rightarrow \mathrm{d}\left(\mathrm{Tx}_{\mathrm{n}}, \mathrm{Tx}_{\mathrm{n}-1}\right)<\epsilon$.
Also, (2.2) implies that there exists an integer N such that $\mathrm{n} \geq \mathrm{N}, \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}-1}\right)<\delta^{\prime / 2}$. for all $\mathrm{n} \in \mathrm{N}$
where $\delta^{\prime}=\min \{\epsilon / 2,(\delta(\epsilon)-\epsilon) / 2\}$.
Let $\mathrm{p}, \mathrm{q} \in \mathrm{N}$, where $\mathrm{p}=\mathrm{n}$ and $\mathrm{q}=\mathrm{m}-1$, therefore

$$
\begin{aligned}
& \epsilon \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{m}-1}\right) \\
& \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{m}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{~T} \mathrm{x}_{\mathrm{n}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{m}-1}, \mathrm{~T} \mathrm{x}_{\mathrm{m}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{~T} \mathrm{x}_{\mathrm{m}-1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{m}-1}, \mathrm{~T} \mathrm{x}_{\mathrm{n}}\right)\right\} \\
& \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{m}-1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{m}-1}, \mathrm{x}_{\mathrm{m}}\right), \frac{\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{m}}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{m}-1}, \mathrm{x}_{\mathrm{n}+1}\right)}{2}\right\} \\
& \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right), \mathrm{d}\left(\frac{\left.\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{q}}, \mathrm{x}_{\mathrm{p}+1}\right) \frac{1}{2}}{2}\right.\right. \\
& \leq \max \left\{\mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right), \mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right)+\frac{\left.\mathrm{d}\left(\mathrm{x}_{\mathrm{q}}, \mathrm{x}_{\mathrm{q}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{q}}, \mathrm{x}_{\mathrm{p}}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{p}+1}\right)\right\}}{2}\right. \\
& \leq \frac{2 \mathrm{~d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{q}}, \mathrm{x}_{\mathrm{q}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{p}+1}\right)}{2} \\
& \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right)+\frac{\mathrm{d}\left(\mathrm{x}_{\mathrm{q}}, \mathrm{x}_{\mathrm{q}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{p}+1}\right)}{2} \\
& \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right)+1 / 2\left(\delta^{\prime} / 2+\delta^{\prime} / 2\right) \leq \epsilon+\delta^{\prime}+\delta^{\prime} / 2<\epsilon+2 \delta^{\prime}<\epsilon+2(\delta(\epsilon)-\epsilon) / 2<\delta(\epsilon) .
\end{aligned}
$$

Therefore

$$
\epsilon \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{p}}, \mathrm{x}_{\mathrm{q}}\right)<\delta(\epsilon) \text {, yielding thereby } \epsilon \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}-1}\right)<\delta(\epsilon) \text {, which implies that } \mathrm{d}\left(\mathrm{~T}_{\mathrm{n}-1}, \mathrm{~T}_{\mathrm{n}}\right) \leq \epsilon
$$

Now, we show that the sequence $\left\{x_{n}\right\}$ is Cauchy. If this sequence is not Cauchy then there exists $2 \epsilon>0$ such that
$\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{n}}\right)>2 \epsilon$.
For any $\mathrm{j} \in[\mathrm{m}, \mathrm{n}]$, one gets $\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{j}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{j}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{j}+1}, \mathrm{x}_{\mathrm{j}}\right)$, which in turn yields
$\left|\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{j}}\right)-\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{j}+1}\right)\right| \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{j}+1}, \mathrm{x}_{\mathrm{j}}\right)<\delta^{\prime} / 2$, and $\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{n}}\right)>2 \epsilon=\epsilon+\epsilon \geq \epsilon+\delta^{\prime}$,
which implies that there exists a $\mathrm{j} \in[\mathrm{m}, \mathrm{n}]$ with $\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{j}}\right) \geq \epsilon+\delta^{\prime}$. However, for m and j , we have
$\mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{j}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{m}}, \mathrm{x}_{\mathrm{m}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{m}+1}, \mathrm{x}_{\mathrm{j}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{j}+1}, \mathrm{x}_{\mathrm{j}}\right) \leq \epsilon+\delta^{\prime} / 2+\delta^{\prime} / 2=\epsilon+\delta^{\prime}$,
which is indeed a contradiction, therefore one, may conclude that the sequence $\left\{x_{n}\right\}$ is Cauchy and it converges to a point $z$ in X .

Now, we assume that there exists a subsequence $\left\{\mathrm{X}_{\mathrm{nk}}\right\}$ of $\left\{\mathrm{x}_{\mathrm{n}}\right\}$ which is contained in P . Using (1.1), one can write
$\mathrm{d}(\mathrm{Tz}, \mathrm{z}) \leq \mathrm{d}\left(\mathrm{Tz}, \mathrm{T} \mathrm{x}_{\mathrm{nk}}\right)+\mathrm{d}\left(\mathrm{T}_{\mathrm{n} k}, \mathrm{z}\right)$,
$\leq \max \left\{\mathrm{d}\left(\mathrm{z}, \mathrm{x}_{\mathrm{nk}}\right), \mathrm{d}\left(\mathrm{z}, \mathrm{T}_{\mathrm{z}}\right), \mathrm{d}\left(\mathrm{X}_{\mathrm{nk}}, \mathrm{T}_{\mathrm{xnk}}\right), \mathrm{d}\left(\frac{\left.\mathrm{z}, \mathrm{Tx}_{\mathrm{nk}}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{nk}}, \mathrm{T}_{\mathrm{z}}\right)}{2}\right\}+\mathrm{d}\left(\mathrm{T}_{\mathrm{n}} \mathrm{nk}, \mathrm{z}\right)\right.$.
On letting $\mathrm{k} \rightarrow \infty$, one obtains $\mathrm{d}(\mathrm{T} \mathrm{z}, \mathrm{z}) \leq \mathrm{d}(\mathrm{T} \mathrm{z}, \mathrm{z})$, which is a contradiction, implies that $\mathrm{T} \mathrm{z}=\mathrm{z}$. This shows that z is a fixed point of $T$.

To prove the uniqueness of the fixed point z , let $\mathrm{z}_{0}$ be the another fixed point of T , then
$\mathrm{d}\left(\mathrm{z}, \mathrm{z}_{0}\right)=\mathrm{d}(\mathrm{Tz}, \mathrm{Tz} 0) \leq \max \left\{\mathrm{d}\left(\mathrm{z}, \mathrm{z}_{0}\right), \mathrm{d}(\mathrm{z}, \mathrm{T} \mathrm{z}), \frac{\mathrm{d}\left(\mathrm{z}_{0}, \mathrm{~T} \mathrm{z}_{0}\right), \mathrm{d}\left(\mathrm{z}, \mathrm{Tz}_{0}\right)}{2}+\mathrm{d}\left(\mathrm{z}_{0}, \mathrm{Tz}\right)\right\} \leq \mathrm{d}\left(\mathrm{z}, \mathrm{z}_{0}\right)$
implying there by $\mathrm{z}=\mathrm{z}_{0}$. This completes the proof.

## Remark 2.2.

By setting $K=X$ in the Theorem 2.1, then we deduce a theorem due to Meir and Keeler [5].

## Remark 2.3.

By setting $\mathrm{K}=\mathrm{X}$ in the Theorem 2.1, then we deduce a partial generalization of theorem due to Rhoades [10] Finally, an example is furnish to establish the existence of the result.

## Example 2.4.

Let $\mathrm{X}=\mathrm{R}$ with Euclidean metric and let $\mathrm{K}=\{-1 / 4\} \cup[0,1 / 2]$. Define the mapping $\mathrm{T}: \mathrm{K} \rightarrow \mathrm{X}$ as
$T \mathrm{x}=\mathrm{x}^{2}-1 / 4$, if $0 \leq \mathrm{x} \leq 1 / 2$ and $\mathrm{Tx}=-1 / 4$, if $\mathrm{x}=-1 / 4$.
Since $\delta K$ (the boundary of $K$ ) $=\{-1 / 4,0,1 / 2\}$. Also
$x=-1 / 4$ implies that $T(-1 / 4)=-1 / 4 \in K, x=0$ implies that $T(0)=-1 / 4 \in K$ and
$x=1 / 2$ implies that $T(1 / 2)=0 \in K$.
This shows that $x \in \delta K$ implies that $T x \in K$.
Moreover, if for $\mathrm{x}, \mathrm{y} \in[0,1 / 2]$, then

$$
\mathrm{d}(\mathrm{~T} x, T \mathrm{y})=\left|\mathrm{x}^{2}-\mathrm{y}^{2}\right| \leq \max \left\{\mathrm{d}(\mathrm{x}, \mathrm{y}), \mathrm{d}(\mathrm{x}, \mathrm{~T} x), \mathrm{d}(\mathrm{y}, \mathrm{~T} y), \frac{\mathrm{d}(\mathrm{x}, \mathrm{~T} \mathrm{y})+\mathrm{d}(\mathrm{y}, \mathrm{Tx})\}}{2}\right.
$$

Next, if $x \in[0,1 / 2]$ and $y=-1 / 4$, then

$$
\mathrm{d}(\mathrm{Tx}, \mathrm{~T} y)=\mathrm{x}^{2}=\mathrm{d}(\mathrm{y}, \mathrm{~T} x) \leq \max \left\{\mathrm{d}(\mathrm{x}, \mathrm{y}), \mathrm{d}(\mathrm{x}, \mathrm{~T} x),(\mathrm{y}, \mathrm{~T} y), \frac{\mathrm{d}(\mathrm{x}, \mathrm{~T} y)+\mathrm{d}(\mathrm{y}, \mathrm{Tx})\}}{2}\right.
$$

Finally, if $y \in[0,1 / 2]$ and $x=-1 / 4$, then
$d(T x, T y)=y^{2}=d(x, T y) \leq \max \left\{d(x, y), d(x, T x),(y, T y), \underline{d(x, T y)+d(y, T x)\}}{ }_{2}\right.$
This shows that the contraction condition (1.1) is satisfied for every $x, y \in K$. Thus all the conditions of the Theorem 2.1 are satisfied and $(-1 / 4)$ is a fixed point of $T$.
