#### Abstract

This research deals with the effect of teaching by using Interactive Approach on the students' reading ability. The objective of the research is to investigate the effect of applying Interactive Approach on the students' reading ability. The sample of this study was 32 students. This study was conducted with an experimental research. The researcher took 1 class of Grade X Students of Madrasah Aliyah Swasta Gp. Teungoh Langsa Municipality as the sample and the class was divided into two treatments. The first treatment was the control group and the second treatment was the experimental group. The experimental group was taught by applying Interactive Approach, and the control group was taught by applying Conventional Approach. The instrument for collecting the data was objective test and essay test. To obtain the reliability of the test, the researcher used Pearson Product Moment formula. The result of the study showed that the reliability of the test was 0.57 . The data were analyzed by using $t$-test formula. The analysis showed that the scores of the students of the experimental group were significantly higher than the scores of the students in the control group at the level significance 0.05 with the degree of freedom ( $d f$ ) 60 at the level of significance 0.05 , it was found out that $\mathrm{t}_{\text {observed }}$ value $4.725>\mathrm{t}_{\text {table }}$ value 3.460 . Therefore, the hypothesis that Interactive Approach significantly affects the students' reading ability is accepted.

## Introduction

## A. Background of Research

Language has a very important function in the process of communication. It is used as a system to express meanings, ideas, thoughts, and etc. language is also a complex cognitive skill, developing through a series of stages, which requires extensive practice and feedback in order to operate at an autonomous level. Language proficiency can be describe as a procedural knowledge and the use of learning strategies is also a part of procedural knowledge, learning is an active and in fact an interactive process. Second language acquisition can be understood adequately only with reference to the interaction between language and cognition. Language is important and useful for people around the world. English as an international language has played a very important role in the era of globalization. It is an international language used in a global setting.

Based on Yoosabai, (2009:65) explains "In Indonesia, English is taught as a foreign language and the purpose of learning English is for communication". There are four language skills that should be well- mastered by students in order that they are able to communicate well in English, namely listening, speaking, reading, and writing. It is obvious that the four language skills are of equal importance. Reading is to widen one's horizon because through it much information and knowledge can be absorbed and in turn will increase one's knowledge.

According to (Grabe and Stoller, 2002:89) defines "Reading is regarded as the most vital and necessary for students in both classroom context and an extracurricular environment." Reading is necessary because it seems to be common source to achieve and develop learners' knowledge and skills. Meanwhile Ozckus, (2003:103) states "They may complete a reading assignment and not even realize that they had problems understanding the text." In fact, many Indonesian students are still having difficulties to find the main ideas and supporting ideas in a text or paragraph. Likewise, they are unfamiliar with synonym in text.

Clark (2003:22) say "the fundamental function of language is for communication. It means that language is used by the speaker/writer to express ideas, feelings, and desires, and to get information from other people." According to Brown (2001:102) states "There are many definitions of reading ability." He states that reading ability is primarily a matter of developing appropriate efficient ability strategies for the majority of second language learners who are already literate in their native language. Grabe and Stoller (2002: 17) also states "reading ability is a crucial skill for all of students to master, especially in today's world of heavy standardized testing". They define reading ability as the ability of understanding and interpreting information a text correctly. The purpose is to get meaning from the written text.

In addition, Alexander (1988 in Nasution, 2009:20) state "successful ability involves the reader's discovering meaning need to achieve the particular purposes set for by him.

It may finding a particular piece of information, solving a problem through reading, working to understand an idea, or following a set of directions."

Reading ability requires effective and efficient reading ability. Grabe and Stoller (2002: 17) state "there are several processes which are involved in effective reading ability." First is interactive process. In the interactive process, linguistic information from the text will be related to the information activated by reader's long term memory as prior knowledge. Second is strategic process. In the strategic process, the reader hopefully will be able to read flexibility in line with changing purposes and at the same times ongoing monitoring development in their ability in comprehending the text. And the last is evaluation process. The reader will also deal with the evaluation process means that they should decide which of the information on the text is important or not.

Not just effective reading, reader also need efficient reading to obtain satisfactory results in reading. Based on Nuttall, (2000:50) says "The first requirement for efficient reading is to know what you want from reading: then you judge your success according to how well and how fast you achieve it." Nasution, (2009:26) explains "reading ability, readers understand as much as possible the message that the writer puts into a text, a reader is not just saying the words, but moreover they is able to identify the main idea. Therefore, when they reads, he/she recognize the words and attaches meaning to them."

According to Berry (2005:66) explains "there are three levels of ability which can allow reader access to information when they are trying to build their understanding." The first level of ability can be called the literal level. In this level, readers are able to remember and answer questions based on what is actually stated in text and just could memorize the information like dates or specific facts what is actually stated. The second level of ability is called the interpretive level. At interpretive level, reader are attempting to understand what the author meant by what they said in the story, paragraph or textbook. The reader must be able to draw inferences, tap into background knowledge or experience. The third level of ability is called the applied level. Applied level is taking what was said (literal) and then what was meant by what was said (interpretative) and then extend (apply) the concepts or ideas beyond the situation. It means that reader have already reached the previous two levels. In this level, reader is analyzing or synthesizing information and applying it to other information.

Based on the explanation above, reading ability level should be viewed as guide for teacher in specifying activities which are aimed at certain ability outcomes, identifying ability task that increase students' chance of success, and structuring questions and activities to identify the appropriate level of structure and the degree of direct instruction.
The following presents some definitions about reading:
1)Reading is defined as a complex system of deriving meaning from print that requires all of the following:

- The skills and knowledge to understand how phonemes, or speech sounds, are connected to print
- The ability to decode unfamiliar words
- The ability to read fluently
- Sufficient background information and vocabulary to foster reading
- The development of appropriate active strategies to construct meaning from print
- The development and maintenance of a motivation to read.
2)Reading is the process of constructing meaning from written text. It is complex skill requiring the coordination of a number of interrelated sources of information (Anderson et. Al. 2000).
3)Reading is the process of constructing meaning through the dynamic interaction among: (1) the reader's existing knowledge; (2) the information suggested by the text being read; and (3) the context of the reading situation (Wixson, Peters, 2000: 33, citing the new definition of reading for Michigan).
4)Reading is a process, reading is strategic, reading is interactive, and reading instruction requires orchestration (Klein, Peterson, Simington, 2001: 34).

According to Olson \& Burns (2005:5) ability is the ability to understand and apply reading material. When the students can get ability from the text, they understand the message of the text. According to Peterson (2001: 56) ability is "the capacity for understanding fully; the act or action of grasping with the intellect". Webster also tells us that reading is toreceive or take in the sense of (as letters or symbols) by scanning; to understand the meaning of written or printed matter; to learn from what one has seen or found in writing or printing.

Kustaryo (2000:32) states "reading is one of the most important skills besides listening, speaking and writing." Further in K13 (Kurikulum 2013) of senior high School Level states that there are four language skills that should be achieved in learning process namely listening, speaking, reading and writing. Reading is one of the four skills that must be mastered. It states that the students are intended to comprehend the text. Reading ability problem, lack of prior knowledge in word recognition, new word recognition, the language system, students' and teachers' factor." Reading ability can be defined as the level of understanding of passage or text. For normal reading rates (around 200-220 words per minute) an acceptable level of ability is above $75 \%$. The goal of reading is constructing meaning in response to text. It requires interactive use of graph phonic, syntactic, and semantic cues to construct meaning. Zuwoski (2002:1) says "reading is a personal interaction, like conversation, between a reader and words on a page."

According to Carrell (2004:14) explains "'reading' must employ memory; it must hold an image, briefly store information, and retain knowledge and understanding." In other words it can be said that reading is an active cognitive process or interacting with print and monitoring ability to establish meaning. The readers use their brain to process information. It decides what task it must handle, what information is available, what strategies it must employ, which input channels to use, where to seek information. The brain seeks to maximize information it acquires and minimize effort and energy used to acquire. Reading can be seen as an "interactive" process between a reader and a text which leads to automaticity or (reading fluency). In this process, the reader interacts dynamically with the text as he/she tries to elicit the meaning and where various kinds of knowledge are being used: linguistic or systemic knowledge (through bottom-up processing) as well as schematic knowledge (through topdown processing). Since reading is a complex process, Grabe (2002:379) argues "many researchers attempt to understand and explain the fluent reading process by analyzing the process into a set of component skills" in reading; consequently researchers proposed at least six general component skills and knowledge areas:

1. Automatic recognition skills
2. Vocabulary and structural knowledge
3. Formal discourse structure knowledge
4. Content/world background knowledge
5. Synthesis and evaluation skills/strategies
6. Metacognitive knowledge and skills monitoring

According to Nits (2001:26) there are three steps to be followed to focus readers' attention to the reading, such as: (1) predicting the contents through analyzing the topic, (2) focus on the reading to find the answers to their prediction, and (3) reread the text to get deeper ability. Therefore, it is clear that one can comprehend reading text well if one can interact with

| Group | Pre-test | Treatment | Post-Test |

| Experimental | $\sqrt{ }$ | Interactive Approach | $\sqrt{ }$ |
| Control | $\sqrt{ }$ | Conventional Approach | $\sqrt{ }$ |

te writer of the text. The information above inspired the researcher to study the effect of interactive Approach on the students' reading ability achievement. There are many factors which make reading ability cannot be achieved. Some of them are motivation, concentration, lack of vocabulary, the difficulty of structure, and the teaching method. Conventional Approach will not enable the students to achieve reading ability to the utmost because the students do not interact actively with the text. Interactive Approach will lead the students to interact with the text, and therefore they will understand what they read. For this instances, the researcher intends to conduct research with entitle "The Effect of Teaching by Using Interactive on the Students Reading Comnprehension (An experimental Research to Tenth Grade Students Madrasah Aliyah Swasta Gp Teungoh, Academic Year 2015-2016, Langsa Municipality, Aceh Province, Indonesia)"

## B. Problem of Research

The problem of the study is formulated as follows: "How does Interactive Approach significantly affect the students' reading
ability to tenth grade students of Madrasah Aliyah Swasta Gp. Teungoh Academic Year 2015/2016?".

## C. Purpose of the Research

In relation to the research problem, the purpose of the research is to find out the significant effect of Interactive Approach in teaching reading toward the students' reading ability to the tenth grade students of Madrasah Aliyah Swasta Gp. Teungoh Academic Year 2015-2016?".

## D. Method of the Research

In order to know the effect of Interactive Approach, the sample is treated into two times: the firs times, the control group is thought by using conventional method and the second times the same class is conducted by using interactive approach that is called the experimental group. The design can be figured out as per as mentioned by Suharsimi (2001: 43)
The population is divided into two groups: Experimental and Control groups.

1. Experimental group is taught by using Interactive Approach, whereas the control group is taught by using conventional strategy.
2. Both groups are given pre-test and post-test.

The data is collected by using objectives test and essay test. The reason for choosing the objective test because:

1. It is effective for measuring.
2. Objective scoring which is quick, easy, and consistent.
3. It usually encourage students to develop a comprehensive knowledge of specific facts and the ability to make a fine discrimination among them. In this case, 20 objectives tests are given to the students.

## E. Result

1) The total pre-test scores of experimental group $\left(\sum X\right)=1764$ and the total post-test scores $\left(\sum X_{I}\right)=2349$. The increase of the scores is 585 point or $32.14 \%$. Here is the table:

## 1. Calculation of Mean (M) of Control Group

$M_{e x}=\frac{\sum Y_{1}}{N}$
$M_{e x}=\frac{2239}{33}$
$M_{e x}=67.85$
2. Calculation of Standard Deviation (SD) of Control Group
$S D_{c}=\sqrt[s]{\frac{\sum d y_{1}}{N}}$
$S D_{c}=\sqrt[s]{\frac{6344}{33}}$
$S D_{c}=\sqrt[3]{192.24}$
$S D_{c}=3 \times 13.86$
$S D_{c}=41.58$
In order to find out the reliability of the test, thewriter used Pearson Product Formula. The calculation of reliability can be shown as in the following:
$R=\frac{N\left(\sum^{\prime} X Y\right)-\left(\sum_{X} X\right)\left(\sum^{\prime} Y\right)}{\sqrt{\left[N\left(\Sigma^{2}\right)-\left(\sum^{2} X\right)^{2}\right]\left[N\left(\Sigma Y^{2}\right)-\left(\sum^{\prime} Y\right)^{2}\right]}}$
$R=\frac{30(154525)-(2140)(2150)}{\sqrt{[30(154750)-(4579600)][30(156050)-(46225000)]}}$
$R=\frac{4635750-460100}{\sqrt{[4642500-4579600][4681500-46225000]}}$
$R=\frac{34750}{\sqrt{[30(154750)-(4579600)][30(156050)-(46225000]}}$
$R=\frac{34750}{\sqrt{(62900)(59000)}}$
$R=\frac{34750}{\sqrt{(3711100000)}}$
$R=\frac{34750}{60918.7}$
$R=0.57$
The value of coefficient correlation was categorized in the following criteria (Purwanto's, 2001:144):
$0.00-0.20=$ no correlation
$0.21-0.40=$ low
$0.41-0.70=$ sufficient
$0.71-0.90=$ high
$0.91-1.00=$ very high.
The result of testing the reliability is 0.57 . It means that the reliability of the test is sufficient. To know the difference effect between experimental and control groups, the researcher used the t -test formula (Dirgayasa, 2005:57) as follow as:

$t=\frac{74.12-66.54}{\sqrt{\left(\frac{11157-5523}{32+33-2}\right)\left(\frac{1}{32}+\frac{1}{33}\right)}}$
$t=\frac{7.58}{\sqrt{(89.43)(0.031)}}$
$t=\frac{7.58}{\sqrt{(2.77)}}$
$t=\frac{7.58}{1.60}$
$t=4.725$
From the degree of freedom of 60 at the level of significance 0.05 , it was found out that $\mathrm{t}_{\text {observed }}$ value $4.725>\mathrm{t}_{\text {table }}$ value 3.460 .

## F.Conclusion

The result showed that the mean of experimental group is higher than that of control group. As shown by the calculation $t$-test presented, the result of $t_{\text {obs }}(4.725)$ is higher than $t_{\text {table }}$ (3.460). This means that the hypothesis stating that Interactive Approach significantly affects the students' reading ability is accepted. The finding showed that teaching by applying Interactive Approach is significantly effect students' ability
