#### Keywords

Total Dominating Color Transversal Set,

Minimal Total Dominating Color Transversal Set,

 $\chi$  - Partition of a graph.

### ABSTRACT

Total Dominating Color Transversal Set of a graph is a Total Dominating Set which is also Transversal of Some  $\chi$  - Partition of vertices of  $G$ . Here  $\chi$  is the Chromatic number of the graph  $G$ . A Total Dominating Color Transversal Set of a graph  $G$  is called Minimal Total Dominating Color Transversal Set of the graph if no proper subset of it is a Total Dominating Color Transversal Set of  $G$ . In this paper, we determine a necessary and sufficient condition under which a Total Dominating Color Transversal Set becomes Minimal. We also obtain Minimal Total Dominating Color Transversal set of Generalised Petersen graph  $P(n, 1)$ .

### 1.Introduction

We begin with simple, finite, connected and undirected graph without isolated vertices. We know that proper coloring of vertices of graph  $G$  partitions the vertex set  $V$  of  $G$  into equivalence classes (also called the color classes of  $G$ ). Using minimum number of colors to properly color all the vertices of  $G$  yields  $\chi$  equivalence classes. Transversal of a  $\chi$  - Partition of  $G$  is a collection of vertices of  $G$  that meets all the color classes of the  $\chi$  - Partition. That is, if  $T$  is a subset of  $V$  (the vertex set of  $G$ ) and  $\{V_1, V_2, \dots, V_\chi\}$  is a  $\chi$  - Partition of  $G$  then  $T$  is called a Transversal of this  $\chi$  - Partition if  $T \cap V_i \neq \emptyset, \forall i \in \{1, 2, \dots, \chi\}$ . Total Dominating Color Transversal Set of graph  $G$  is a Total Dominating Set with the extra property that it is also Transversal of some such  $\chi$  - Partition of  $G$ .

We first mention definitions.

### 2. Definitions

**Definition 2.1[4]: (Total Dominating Set)** Let  $G = (V, E)$  be a graph. Then a subset  $S$  of  $V$  (the vertex set of  $G$ ) is said to be a Total Dominating Set of  $G$  if for each  $v \in V$ ,  $v$  is adjacent to some vertex in  $S$ .

**Definition 2.2[4]: (Minimum Total Dominating Set/Total Domination number)** Let  $G = (V, E)$  be a graph. Then a Total Dominating set  $S$  is said to be a Minimum Total Dominating set of  $G$  if  $|S| = \text{minimum } \{ |D| : D \text{ is a Total Dominating set of } G \}$ . Here  $S$  is called  $\gamma_t$  -set and its cardinality, denoted by  $\gamma_t(G)$  or just by  $\gamma_t$ , is called the Total Domination number of  $G$ .

**Definition 2.3[1]: ( $\chi$  -partition of a graph)** Proper coloring of vertices of a graph  $G$ , by using minimum number of colors, yields minimum number of independent subsets of vertex set of  $G$  called equivalence classes (also called color classes of

$G$ ). Such a partition of a vertex set of  $G$  is called a  $\chi$  - Partition of the graph  $G$ .

**Definition 2.4[1]: (Transversal of a  $\chi$  - Partition of a graph)** Let  $G = (V, E)$  be a graph with  $\chi$  - Partition  $\{V_1, V_2, \dots, V_\chi\}$ . Then a set  $S \subset V$  is called a Transversal of this  $\chi$  - Partition if  $S \cap V_i \neq \emptyset, \forall i \in \{1, 2, 3, \dots, \chi\}$ .

**Definition 2.5[1]: (Total Dominating Color Transversal Set)** Let  $G = (V, E)$  be a graph. Then a Total Dominating Set  $S \subset V$  is called a Total Dominating Color Transversal Set of  $G$  if it is Transversal of at least one  $\chi$  - partition of  $G$ .

**Definition 2.6[1]: (Minimal Total Dominating Color Transversal Set)** Let  $G = (V, E)$  be a graph and  $S \subset V$  be a Total Dominating Transversal Set of  $G$ . Then  $S$  is called Minimal Total Dominating Color Transversal of  $G$  if no proper subset of  $S$  is a Total Dominating Color Transversal Set of  $G$ .

**Definition 2.7 [5]: (Generalised Petersen Graph)** Let  $n, k$  be the positive integers such that  $n \geq 3$  and  $1 \leq k \leq \frac{n}{2}$ . The

generalised Petersen graph  $P(n, k)$  is the graph whose vertex set is  $\{a_i, b_i / 1 \leq i \leq n\}$  and whose edge set is  $\{ \{a_i, b_i\}, \{a_i, a_{i+1}\}, \{b_i, b_{i+k}\} / 1 \leq i \leq n \}$  where  $a_{n+c} = a_c$  and  $b_{n+c} = b_c$  for every  $c \geq 1$ .

### 3. Main results

First we state the following theorem taken from [1].

**Theorem 3.1 [1]:** If  $G$  is a graph with  $\chi(G) = 2$  then  $\gamma_{tstd}(G) = \gamma_t(G)$ .

**Remark 3.2:** Let  $G$  be a graph with  $\chi(G) = 2$ . Then any Total Dominating Set of  $G$  will be a Transversal of every  $\chi$  - Partition of  $G$ . Hence any Total Dominating Set of  $G$  will be Total Dominating Color Transversal Set of  $G$ .

We now state necessary and sufficient condition under which Total Dominating Color Transversal Set of a graph is Minimal.

**Theorem 3.3:** A Total Dominating Color Transversal Set  $D$  of a graph  $G = (V, E)$  is Minimal iff for every  $u \in D$  at least one of the following conditions hold:

- I) There exists  $v \in V \setminus \{u\}$  such that  $N(v) \cap D = \{u\}$ .  
 II) For every  $\chi$ -Partition  $\{V_1, V_2, V_3, \dots, V_\chi\}$  there exists  $V_i$  such that  $V_i \cap D = \{u\}$  or  $\phi$ .

**Proof:** Let  $D$  be a Total Dominating Color Transversal Set of a graph  $G$ . First assume that  $D$  is a Minimal Total Dominating Color Transversal Set of  $G$ . Then for every  $u \in D$ ,  $D \setminus \{u\}$  is not a Total Dominating Color Transversal Set of  $G$ . Then  $D \setminus \{u\}$  is not a Total Dominating Set of  $G$  or  $D \setminus \{u\}$  is not a transversal for every  $\chi$ -Partition of  $G$ .

Case (i):  $D \setminus \{u\}$  is not a Total Dominating of  $G$ .

In such case there exists  $v \in V$  such that it is not adjacent to any vertex of  $D \setminus \{u\}$ . Note that  $v \neq u$  as if  $v = u$  then  $u$  is an isolate of  $D$  which is not possible as  $D$  is a Total Dominating Set of  $G$ . Hence we are left with two possibilities viz., (a)  $v \in V \setminus D$  or (b)  $v \in D \setminus \{u\}$ .

(a)  $v \in V \setminus D$ .  $v$  is not adjacent to any of  $D \setminus \{u\}$ .  $v \in V \setminus D$  and  $D$  is a Total Dominating set together implies that  $v$  is adjacent to  $u$  only. Hence  $N(v) \cap D = \{u\}$ .

(b)  $v \in D \setminus \{u\}$ .  $v$  is not adjacent to any of  $D \setminus \{u\}$  implies that  $v$  is an isolate of  $D \setminus \{u\}$ . As  $D$  is a Total Dominating set,  $v$  is adjacent to  $u$  only in  $D$ . Hence  $N(v) \cap D = \{u\}$ .

Case (ii):  $D \setminus \{u\}$  is not a transversal of every  $\chi$ -Partition  $\{V_1, V_2, V_3, \dots, V_\chi\}$  of  $G$ .

In such case  $D \setminus \{u\} \cap V_i = \phi$ , for some  $i \in \{1, 2, \dots, n\}$ . Hence  $D \cap V_i = \phi$  or  $\{u\}$  for some  $i \in \{1, 2, \dots, n\}$ .

Conversely assume at least one of the two conditions. Suppose  $D$  is Total Dominating Color Transversal Set of  $G$  but not a Minimal Total Dominating Color Transversal Set of  $G$ . Hence  $D$  and  $D \setminus \{u\}$  are total Dominating Color Transversal Sets of  $G$  for some  $u \in D$ . As  $D$  and  $D \setminus \{u\}$  are Total Dominating Sets of  $G$  there does not exist any  $v \in V \setminus \{u\}$  such that  $N(v) \cap D = \{u\}$ . So by our assumption condition (II) must hold.

Consider  $\chi$ -Partition  $\{V_1, V_2, V_3, \dots, V_\chi\}$  of  $G$  such that  $D \setminus \{u\}$  and  $D$  are transversals of it. Then  $D \setminus \{u\} \cap V_i \neq \phi$ , and  $D \cap V_i \neq \phi$  for every  $i \in \{1, 2, \dots, n\}$ . This means that  $D \cap V_i \neq \phi, \{u\}$ . Therefore condition (II) also fails to hold. Hence both the conditions fails to hold, which is a contradiction.

Hence  $D$  is a Minimal Total Dominating Color Transversal Set of  $G$ .

Hence the theorem. ■

Now we obtain the Minimal Total Dominating Color Transversal Set of very Interesting and Special Graph called Generalised Petersen Graph  $P(n, 1)$ .

Generalised Petersen Graph  $P(n, 1)$

Figure 1

**Proposition 3.4** -  $\chi(P(n, 1)) = 2$  if  $n$  is even  
 $= 3$  if  $n$  is odd.

**Proof:** Consider the above drawn Generalised Petersen Graph  $P(n, 1)$ . In our proof color pair  $(i, j)$  assigned to vertex pair  $(u, v)$  will mean colors  $i$  and  $j$  are assigned to  $u$  and  $v$  respectively.

Case 1:  $n$  is even

Assign color pair  $(1, 2)$  to each pairs  $(u_1, v_1), (u_3, v_3), \dots, (u_{n-1}, v_{n-1})$  and color pair  $(2, 1)$  to  $(u_2, v_2), (u_4, v_4), \dots, (u_n, v_n)$ .

Therefore in this case  $\chi(P(n, 1)) = 2$ .

Case 2:  $n$  is odd

In this case  $P(n, 1)$  contains odd cycle. So at least three colors are required to color it. We Prove that exactly three colors are required to properly color  $P(n, 1)$ .

Divide then vertices pairs  $(u_i, v_i)$  into groups of three pairs are  $\{(u_1, v_1), (u_2, v_2), (u_3, v_3)\}, \{(u_4, v_4), (u_5, v_5), (u_6, v_6)\}, \dots$  where the last group may contain one, two or three pairs.

Sub Case 1: Last group has just one pair.

In such case,  $n \geq 4$ . Then  $P(n, 1)$  can be properly colored by using three colors 1, 2 and 3 as  $\{(1, 2), (2, 3), (3, 1)\}, \{(2, 3), (3, 1), (1, 2)\}, \dots, \{(2, 3)\}$ .

Sub Case 2. Last group has two pairs.

In such case,  $n \geq 5$ . Then  $P(n, 1)$  can be properly colored by using three colors 1, 2 and 3 as  $\{(1, 2), (2, 3), (3, 1)\}, \{(2, 3), (3, 1), (1, 2)\}, \dots, \{(2, 3), (3, 1)\}$ .

Sub Case 3. Last group has three pairs.

In such case  $n \geq 3$ . Then  $P(n, 1)$  can be properly colored by using three colors 1, 2 and 3 as  $\{(1, 2), (2, 3), (3, 1)\}, \{(1, 2), (2, 3), (3, 1)\}, \dots, \{(1, 2), (2, 3), (3, 1)\}$ .

Therefore in this case  $\chi(P(n, 1)) = 3$ . ■

**Result 3.5**

- 1) If  $n$  is even and  $n \equiv 0 \pmod{3}$  then  $3k = n$  for some even  $k$ .
- 2) If  $n$  is odd and  $n \equiv 0 \pmod{3}$  then  $3k = n$  for some odd  $k$ .

**Theorem 3.6:** A Minimal Total Dominating Color Transversal Set of the generalised Petersen graph  $P(n, 1)$  is as follows:

⇒ When  $n$  is even

$$D = \begin{cases} \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-5}, u_{n-4}, v_{n-2}, v_{n-1}\} \text{ with } |D| = \frac{2n}{3}, n \equiv 0 \pmod{3} \\ \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-3}, u_{n-2}, v_n, v_1\} \text{ with } |D| = \frac{2n+4}{3}, n \equiv 1 \pmod{3} \\ \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, v_{n-4}, v_{n-3}, u_{n-1}, u_n\} \text{ with } |D| = \frac{2n+2}{3}, n \equiv 2 \pmod{3} \end{cases}$$

⇒ When  $n$  is odd

$$D = \{u_1, u_2, u_3\} \text{ with } |D| = 3, (n=3)$$

$$\{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-5}, u_{n-4}, v_{n-2}, v_{n-1}\} \text{ with } |D| = \frac{2n}{3}, n \equiv 0 \pmod{3} (n > 3)$$

$$\{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, v_{n-3}, v_{n-2}, u_n\} \text{ with } |D| = \frac{2n+1}{3}, n \equiv 1 \pmod{3}$$

$$\{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-4}, u_{n-3}, v_{n-1}, v_n\} \text{ with } |D| = \frac{2n+2}{3}, n \equiv 2 \pmod{3}$$

**Proof:** Consider the Generalized Petersen Graph drawn in Figure 1.

Divide the vertices into groups of three pairs as  $(u_1, u_2, u_3)$ ,  $(u_4, u_5, u_6)$ , ..... where the last group  $v_1, v_2, v_3, v_4, v_5, v_6$  may have one, two or three pairs.

Case 1:  $n$  is even

We know by Proposition 3.4 that  $P(n, 1)$  is bipartite. So obviously any Total Dominating Set of  $P(n, 1)$  is a Total Dominating Color Transversal Set of  $P(n, 1)$ .

Sub Case 1(a):  $n \equiv 0 \pmod{3}$

By above Result 3.5, the number of groups of three pairs will be even. From each odd group of three pairs select first two  $u_i$ 's and from each even group of three pairs select first two  $v_i$ 's. The resultant set  $D = \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-5}, u_{n-4}, v_{n-2}, v_{n-1}\}$  is a Minimal Total Dominating Color Transversal Set of  $P(n, 1)$  with  $|D| = \frac{2n}{3}$ .

Sub Case 1(b):  $n \equiv 1 \pmod{3}$

In this case  $n \geq 4$ .

Note that as  $n-1 \equiv 0 \pmod{3}$  and  $n-1$  is odd, by Result 3.5, the number of groups of three pairs will be odd and last group will have just one pair  $(u_n)$ . From each odd groups of three pairs select first two  $u_i$ 's and from each even group of three pairs select first two  $v_i$ 's. Also select  $v_n$  and  $v_1$ . In this case note that the last group of three pairs of vertices is an even group. The resultant set  $D = \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-3}, u_{n-2}, v_n, v_1\}$  is a Minimal Total Dominating Color Transversal Set of  $P(n, 1)$  with  $|D| = \frac{2(n-1)}{3} + 2 = \frac{2n+4}{3}$ .

Sub Case 1(c):  $n \equiv 2 \pmod{3}$

In this case  $n \geq 8$ .

Note that as  $n-2 \equiv 0 \pmod{3}$  and  $n-2$  is even, by Result 3.5, the number of groups of three pairs will be even and the last group will have  $(u_{n-1}, u_n)$ . From each odd groups of three pairs select first two  $u_i$ 's and from each even group of three pairs select first two  $v_i$ 's. Also select  $u_{n-1}$  and  $u_n$ . In this case note that the last group of two pairs of vertices is an even group.

The resultant set  $D = \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, v_{n-4}, v_{n-3}, u_{n-1}, u_n\}$  is a Minimal Total Dominating Color Transversal Set of  $P(n, 1)$  with  $|D| = \frac{2(n-2)}{3} + 2 = \frac{2n+2}{3}$ .

Case 2:  $n$  is odd

Sub Case 2(a):  $n \equiv 0 \pmod{3}$

In this Case  $n \geq 3$ .

⇒ For  $n = 3$

$P(3, 1)$  Figure 2

$D = \{u_1, u_2, u_3\}$  is a Minimal Total Dominating Color Transversal Set of  $P(3, 1)$  with proper 3-coloring is shown in Figure 2.

⇒ For  $n > 3$  (That is in this case  $n \geq 9$ )

By Result 3.5, number of groups of three pairs will be odd. Select the vertices as in Sub Case 1(a), we get a Minimal Total Dominating Color Transversal Set of  $P(n, 1)$  with  $|D| = \frac{2n}{3}$

with proper 3-coloring of vertices of  $P(n, 1)$  as follows:  $(1, 2, 3), (1, 2, 3), (1, 2, 3), \dots, (1, 2, 3)$ .

$2, 3, 1, 2, 3, 1, 2, 3, 1, 2, 3, 1$

Sub Case 2(b):  $n \equiv 1 \pmod{3}$

In this Case  $n \geq 7$ .

Here as  $n-1 \equiv 0 \pmod{3}$  and as  $n-1$  is even by Result 3.5, the number of groups of three pairs will be even. From each odd group of three pairs select first two  $u_i$ 's and from each even group of three pairs select first two  $v_i$ 's. The last group, which is an odd group, will have  $(u_n)$ . From this group select  $v_n$ .

The resultant set  $D = \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, v_{n-3}, v_{n-2}, u_n\}$  is a Minimal Total Dominating Color Transversal Set of  $P(n, 1)$  with  $|D| = \frac{2(n-1)}{3} + 1 = \frac{2n+1}{3}$

with proper 3-coloring of  $P(n, 1)$  is same as follows:  $(1, 2, 3), (1, 2, 3), (2, 3, 1), \dots, (2)$ .

$2, 3, 1, 2, 3, 1, 3, 1, 2, 3$

Sub Case 2(c):  $n \equiv 2 \pmod{3}$

In this case  $n \geq 5$ .

Here as  $n-2 \equiv 0 \pmod{3}$  and  $n-2$  is odd by Result 3.5, the number of groups of three pairs will be odd. Select first two  $u_i$ 's and from each even group of three pairs select first two  $v_i$ 's. From the last group, which is an even group, will have  $(u_{n-1}, u_n)$ . Select  $v_{n-1}$  and  $v_n$  from it. The resultant set  $D = \{u_1, u_2, v_4, v_5, u_7, u_8, v_{10}, v_{11}, \dots, u_{n-4}, u_{n-3}, v_{n-1}, v_n\}$  is a Minimal Total Dominating Color Transversal of  $P(n, 1)$  with  $|D| = \frac{2(n-2)}{3} + 2 = \frac{2n+2}{3}$

with proper 3-coloring of  $P(n, 1)$  is as follows:  $(1, 2, 3), (1, 2, 3), (1, 2, 3), \dots, (1, 2)$ .

$2, 3, 1, 2, 3, 1, 2, 3, 1, 2, 3$

#### 4. Concluding Remarks

Minimal Total Dominating Color Transversal Set of Generalised Petersen graph  $P(n, 1)$  is in fact Minimal Total Dominating Set of the graph. This set for Generalised Petersen Graph  $P(n, k)$  ( $k > 2$ ) is still to be obtained and it becomes an open problem.
