#### Abstract

The present paper is an attempt to illustrate the direct formula for calculating total number of similar rectangles present, when any rectangle is sub divided into $n \times n$ congruent rectangles. Subdivision of any rectangle into $n \times n$ congruent rectangles means sides of the rectangle divided into $n$ equal parts and points are joined in a sense that it forms $n \times n=n^{2}$ number of congruent rectangles.

## Introduction

In this paper we consider a rectangle ABCD with length x and breadth $y$. Divide each side into $n$ equal parts with lengths $\mathrm{x} / \mathrm{n}, \mathrm{y} / \mathrm{n}$. Rectangles with length $\mathrm{x} / \mathrm{n}$ and breadth $\mathrm{y} / \mathrm{n}$ are congruent to each other. There are $n \times n=n^{2}$ number of congruent rectangles. By the side ratio theorem rectangles with sides of length \& breadth ( $\mathrm{x} / \mathrm{n}, \mathrm{y} / \mathrm{n}$ ), ( $2 \mathrm{x} / \mathrm{n}, 2 \mathrm{y} / \mathrm{n}$ ) $(3 \mathrm{x} / \mathrm{n}, 3 \mathrm{y} / \mathrm{n})$, $\ldots \ldots \ldots \ldots \ldots \ldots,((n-1) x / n,(n-1) y / n),(x, y)$ are similar to each other. In the following investigation, we determine the number of similar rectangles when an arbitrary rectangle is subdivided into $n \times n=n^{2}$ numbers of congruent rectangles.

## Congruency and similarity

Case-1 ( $2 \times 2$ subdivisions)

Fig 1.
In Fig - 1 we have consider rectangle ABCD with $\mathrm{AB}=\mathrm{CD}=\mathrm{x}$, $\mathrm{BC}=\mathrm{AD}=\mathrm{y}$. Let us subdivide it into $2 \times 2=4$ congruent rectangles. Let $\mathrm{E}, \mathrm{F}, \mathrm{H}, \mathrm{I}$ be mid points of $\mathrm{AB}, \mathrm{AD}, \mathrm{BC}, \mathrm{CD}$ such that
$\mathrm{AE}=\mathrm{BE}=\mathrm{CI}=\mathrm{DI}=\frac{x}{2}$,
$\mathrm{BH}=\mathrm{HC}=\mathrm{AF}=\mathrm{DF}=\frac{y}{2}$.
Points are joined in a sense that it forms $2 \times 2=4$ congruent rectangles.
Then
$\mathrm{AE}||\mathrm{FG}|| \mathrm{DI}, \quad \mathrm{EB}| | \mathrm{GH}| | \mathrm{IC}$,
$\mathrm{AF}||\mathrm{EG}| \mathrm{BH}, \quad \mathrm{FD}||\mathrm{GI}| \mid \mathrm{HC}$
So,
$\mathrm{FG}=\mathrm{GH}=\frac{x}{2}, \mathrm{EG}=\mathrm{GI}=\frac{y}{2}$.
Now rectangles AEGF, EBHG, GHCI, and FGID are congruent to each other with length $x / 2$ and breadth $y / 2$. So, by side ratio theorem rectangle AEGF, EBHG, GHCI, FGID, ABCD are similar to each other.
Case 2 ( $3 \times 3$ subdivisions)

Fig 2.
In Fig - 2 we have consider rectangle ABCD with $\mathrm{AB}=\mathrm{CD}=\mathrm{x}$, $\mathrm{BC}=\mathrm{AD}=\mathrm{y}$. Let us subdivide it into $3 \times 3=9$ congruent rectangle. Trisect segments $\mathrm{AB}, \mathrm{BC}, \mathrm{CD}, \mathrm{AD}$ so that
$\mathrm{AE}=\mathrm{EF}=\mathrm{FB}=\mathrm{DO}=\mathrm{OP}=\mathrm{PC}=\frac{x}{2}$,
$\mathrm{AG}=\mathrm{GK}=\mathrm{KD}=\mathrm{BJ}=\mathrm{JN}=\mathrm{NC}=\frac{y}{2}$.
Points are joined in a sense that it forms $3 \times 3=9$ congruent rectangles.
Then
AE\||GH||KL||DO, $\mathrm{EF}\|\mathrm{HI}\| \mathrm{LM} \| \mathrm{OP}$,
$\mathrm{FB}\|\mathrm{IJ}\| \mathrm{MN}\|\mathrm{PC}, ~ \mathrm{AG}\| \mathrm{EH}\|\mathrm{FI}\| \mathrm{BJ}$,
GK||HL||IM $\|\mathrm{JN}, \mathrm{KD}\| \mathrm{LO}|\mid \mathrm{MP} \| \mathrm{NC}$.
So,
$\mathrm{AE}=\mathrm{EF}=\mathrm{FB}=\mathrm{GH}=\mathrm{HI}=\mathrm{IJ}=\mathrm{KL}=\mathrm{LM}=\mathrm{MN}=\mathrm{DO}=\mathrm{OP}=$ $P C=x / 3$,
$\mathrm{AG}=\mathrm{GK}=\mathrm{KD}=\mathrm{EH}==\mathrm{HL}=\mathrm{LO}=\mathrm{FI}=\mathrm{IM}=\mathrm{MP}=\mathrm{BJ}=\mathrm{JN}$ $=N C=y / 3$.

Now, rectangles AEHG, EFIH, FBJI, GHIK, HIML, IJNM, KLOD, LMPO, and MNCP are congruent to each other with length $x / 3$ and breadth $y / 3$.

Again rectangles AFMK, EBNL, GIPD, and HJCO are congruent to each other with length $2 x / 3$ and breadth $2 y / 3$. So, by side ratio theorem rectangle AEHG, EFIH, FBJI, GHIK, HIML, IJNM, KLOD, LMPO, MNCP, AFMK, EBNL, GIPD, HJCO , ABCD are similar to each other.
Case-3 Generalization ( $n \times n=n^{2}$ Subdivisions)
Similarly, we can investigate for $n \times n=n^{2}$ subdivisions. To keep track of similar rectangles, it is helpful to represent rectangles of various dimensions graphically as suggested in Fig - 3 to Fig - 7

Rectangles of length $x / n$ and breadth $y / n$ represented by

Fig 3. Rectangles of length $2 x / n$ and breadth $2 y / n$ represented by

Fig 4. Rectangles of length $3 x / n$ and breadth $3 y / n$

Fig 5. Rectangles of length $4 \mathbf{x} / \mathbf{n}$ and breadth $4 / n$ represented by

Fig 6. Rectangles of length $5 \mathrm{x} / \mathrm{n}$ and breadth $5 \mathrm{y} / \mathrm{n}$ represented by

Fig 7.
We use above representations (Fig -3 to $\mathrm{Fig}-7$ ) to count number of similar rectangles with $n \times n=n^{2}$ subdivisions for $1 \leq n \leq 5$, then look for pattern in our collected data in an effort to generalize our findings.
Description of Counting of Similar Rectangles
Now, we describe how to count similar rectangles when any rectangle is subdivided into $n \times n=n^{2}$ subdivisions for $1 \leq n \leq 5$ as follows:
(I) For (1 X 1) Rectangle

Fig 8. No. of Rectangle $=1=\mathbf{1}^{\mathbf{2}}$
(2) For (2X 2) Rectangle

Fig 9. No. of Rectangles $=1+4=1^{2}+\mathbf{2}^{2}$
(3) For ( $3 \times 3$ ) Rectangle

$\left(5+4=9=3^{2}\right)$

$\left(1+1+1+1=4=2^{2}\right)$

$\left(1=1^{2}\right)$
Fig 10. No. of Rectangles $=1+4+9=1^{2}+2^{2}+3^{2}$
(4) For (4 X 4) Rectangle

Fig 11. No. of Rectangles $=1+4+9+16=1^{2}+2^{2}+3^{2}+4^{2}$ (5) For (5 X 5) Rectangle

(6) For $n \times n=n^{2}$ Rectangles

By analyzing all the five cases we can write a possible expression for $n \times n=n^{2}$

## Total Number of Similar Rectangles

$1^{2}+2^{2}+3^{2}+$ $\qquad$ $+n^{2}=n(n+1)(2 n+1) / 6$

## Verification of general formula

Table - 1 contains the no. of similar rectangles present when any rectangle is subdivided into $n \times n=n^{2}$ congruent rectangles both by using general counting and the given formula.

| $n \times n$ | General Counting | By Formula | $n \times n$ | General Counting | By Formula |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $1 \times 1$ | 1 | 1 | $2 \times 2$ | 5 | 5 |
| $3 \times 3$ | 14 | 14 | $4 \times 4$ | 30 | 30 |
| $5 \times 5$ | 55 | 55 | $6 \times 6$ | 91 | 91 |
| $7 \times 7$ | 140 | 140 | $8 \times 8$ | 204 | 204 |
| $9 \times 9$ | 285 | 285 | $10 \times 10$ | 385 | 385 |
| $11 \times 11$ | 506 | 506 | $12 \times 12$ | 650 | 650 |
| $13 \times 13$ | 819 | 819 | $14 \times 14$ | 1015 | 1015 |
| $15 \times 15$ | 1240 | 1240 | $16 \times 16$ | 1496 | 1496 |
| $17 \times 17$ | 1785 | 1785 | $18 \times 18$ | 2109 | 2109 |
| $19 \times 19$ | 2470 | 2470 | $20 \times 20$ | 2870 | 2870 |
| $21 \times 21$ | 3311 | 3311 | $22 \times 22$ | 3795 | 3795 |
| $23 \times 23$ | 4324 | 4324 | $24 \times 24$ | 4900 | 4900 |
| $25 \times 25$ | 5525 | 5525 | $26 \times 26$ | 6201 | 6201 |
| $27 \times 27$ | 6930 | 6930 | $28 \times 28$ | 7714 | 7714 |
| $29 \times 29$ | 8555 | 8555 | $30 \times 30$ | 9455 | 9455 |
| $31 \times 31$ | 10416 | 10416 | $32 \times 32$ | 11440 | 11440 |
| $33 \times 33$ | 12529 | 12529 | $34 \times 34$ | 13685 | 13685 |
| $35 \times 35$ | 14910 | 14910 | $36 \times 36$ | 16206 | 16206 |
| $37 \times 37$ | 17575 | 17575 | $38 \times 38$ | 19019 | 19019 |
| $39 \times 39$ | 20540 | 20540 | $40 \times 40$ | 22140 | 22140 |
| $41 \times 41$ | 23821 | 23821 | $42 \times 42$ | 25585 | 25585 |
| $43 \times 43$ | 27434 | 27434 | $44 \times 44$ | 29370 | 29370 |
| $45 \times 45$ | 31395 | 31395 | $46 \times 46$ | 33511 | 33511 |
| $47 \times 47$ | 35720 | 35720 | $48 \times 48$ | 38024 | 38024 |
| $49 \times 49$ | 40425 | 40425 | $50 \times 50$ | 42925 | 42925 |

## Conclusion

In this paper we give a direct formula to find the total number of similar rectangles present when any rectangle is subdivided into $n \times n=n^{2}$ congruent rectangles. By this formula easily one can find the result without general counting.
