Pyrrolo-pyrimidine ring,
Dihedral angle,
Crystal packing,
$\pi-\pi$ interaction.

#### Abstract

In the title compound, $\mathrm{C}_{22} \mathrm{H}_{19} \mathrm{ClN}_{4}$, the pyrrole and pyrimidine rings form a dihetrocyclic fused pyrrolo-pyrimidine ring system which is almost co-planar; dihedral angle between two ring planes is $6.2^{\circ}$, to which five membered pyrrolidine ring is substituted, which is puckered to attain half chair conformation. Two other rings chloro-phenyl and phenyl are substituted at the 7 and 9 positions respectively in the fused ring system. Chloro-phenyl ring also shares the plane of fused ring system. (Dihedral angle between two ring system is $12.4^{\circ}$.) Crystal packing is stabilized due to $\pi-\pi$ interaction observed between pyrrole and chloro-phenyl ring of its symmetry related molecules (centroid-centroid distance: 3.8641 $\AA$ ). Intramolecular C-H...N hydrogen bond is also observed in the molecular structure.

## Introduction

Pyrrolo[2,3-d]pyrimidine belongs to an important class of biologically active heterocyclic compounds. These groups of compounds are very well recognized for their biological activities like anti-tumor, anti-allergic, anti viral and anti inflammatory [1-5] and are structurally very much related to nucleosides and some anti-biotics [6-7]. As a part of interest in studying such heterocyclic compounds [8-9], we have synthesized the title compound, 7-(4-Chloro-phenyl)-5-phenyl-4-pyrrolodin-1-yl-7H-pyrrolo[2,3-d] pyrimidine, $\left(\mathrm{C}_{22} \mathrm{H}_{19} \mathrm{ClN}_{4}\right)$ and report its three dimensional structure. The chemical structure of the title compound is shown in Fig. 1.

## Experimental

The title compound is synthesized by nucleophilic displacement reaction method. It is well-known that single crystals are pre-requisite for the three dimensional study employing the X-Ray diffraction technique. So using slow evaporation method, transparent rectangular needle shaped diffraction quality single crystals (Fig. 2) of the title compound are grown in worm ethanol as the solvent at room temperature. A crystal of $0.35 \times 0.20 \times 0.15 \mathrm{~mm}$ size has been used to collect the intensity data on CCD Diffractometer (Smart Apex-II) at CSMCRI, Bhavnagar with graphite monochromated $\mathrm{MoK}_{\alpha}$ radiation by $\omega-2 \theta$ scan mode [10]. The intensity data collection detail is tabulated in Table. 1. In addition, the density is measured by flotation method using potassium iodide solution. Measured density confirmed number of molecules per unit cell is 4. Structure solution and Refinement

The structure is solved by Direct methods using WinGX programme [11]. The structure is refined with full-matrix least squares procedure in which H atoms have been located from difference Fourier map and refined isotropically using SHELXS programme [12] and the data are tabulated in Table. 2. The fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\AA^{2}$ ) of all atoms are tabulated in Table. 3. The Atomic displacement parameters $\left(\AA^{2}\right)$ of non-
hydrogen atoms are listed in Table. 4. The final residual index R is converged to 0.0522 and $\omega \mathrm{R}(\mathrm{F} 2)=0.0696$ for 2924 reflections ( $\mathrm{I}>2 \sigma(\mathrm{I})$ ) and 320 parameters. The goodness of fit S has the value 1.053 . The title compound is crystallized into orthorhombic system with $\mathrm{Pca} 2_{1}$ space group with lattice parameters $\mathrm{a}=7.8104$ (13), $\mathrm{b}=13.1789$ (21) and $\mathrm{c}=17.7368$ (28) A. In Table. 5, the preliminary crystallographic data are listed. The ORTEP diagram of the molecule showing $50 \%$ probability of the displacement ellipsoids is depicted in Fig. 3. The intermolecular hydrogen bonding interactions and the molecular graphics are prepared using PARST [13] and PLATON software programmes [14]. The selected bond lengths and bond angles are listed in Table. 6 and Table. 7 respectively.

## Result and Discussion

In the crystal structure, a five membered pyrrole ring fused to a six membered pyrimidine ring with varied substituents Chloro-phenyl at pyrrole $\mathrm{N}_{1}$ and phenyl ring at atom $\mathrm{C}_{3}$ of pyrrole and a five membered pyrrolidine ring at $\mathrm{C}_{5}$ of pyrimidine ring. Molecular dimension of the central fused ring system is comparable with those reported in other pyrrolopyrimidine derivatives reported [15]. As expected, fusion of the two rings affects the neighbouring bond lengths and angles. The $\mathrm{N}-\mathrm{C}$ bond lengths varies over a wide range 1.317(4) $\AA$ to 1.427(4) $\AA$ and accordingly the length of C-C bond ranges from 1.347(4) $\AA$ to $1.439(4) \AA$. The endocyclic angles at $\mathrm{C}_{7}$ and $\mathrm{C}_{9}$ open up to $130.3(3)\left(\mathrm{N}_{8}-\mathrm{C}_{7}-\mathrm{N}_{6}\right)$ and $126.4(3)^{0}\left(\mathrm{~N}_{8}-\mathrm{C}_{9}-\mathrm{C}_{4}\right)$ and the effect is also observed at exocyclic angle viz $\mathrm{C}_{3}-\mathrm{C}_{4}-\mathrm{C}_{5}$ is
$138.7(3)^{0}$ and $\mathrm{N}_{1}-\mathrm{C}_{9}-\mathrm{C}_{8}=124.4(3)^{0}$. The weighted average C-C bond length in the substituted phenyl rings $\mathrm{C}_{10} \quad \ldots \mathrm{C}_{15}$ and $\mathrm{C}_{17} \ldots \mathrm{C}_{22}$ lie in the range and $1.383(2) \AA$ respectively and the range of these values agree reasonably well with the literature values [16]. Bond angles in the two benzene rings vary from $118.1(3)^{\circ}$ to $121.0(3)^{\circ}$ with an average value at $120.0(3)^{\circ}$ which coincides exactly with the theoretical values of $\mathrm{Sp}^{2}$ hybridization.

The weighted average absolute intra-ring torsional angles of the five membered pyrrole ring is $2.80(2)^{\circ}$ and that of for six membered pyrimidine ring is $7.2(2)^{\circ}$ confirming an almost planar configuration of the rings which is further supported by dihedral angle of $6.21(2)^{\circ}$ between the least-square planes of pyrroles and pyrimidine rings. Six membered pyrimidine ring is distorted to adopt screw boat conformation. The puckering parameter of the pyrimidine ring is puckering amplitude $\mathrm{Q}=$ $0.098(3), \mathrm{q} 2=0.091 \AA, \theta=68.7(18)^{\circ}, \mathrm{q} 3=0.036(3) \AA$ and $\quad \phi$ $=146(2)^{\circ}$.

Distortion of the pyrimidine ring results in the non-planar configuration of the central ring system. Interestingly in most of the analogous derivatives pyrimidine adopts a planar configuration. Five membered pyrrolidine, as commonly observed is highly puckered to adopt a half-chair conformation. The puckering parameters are puckering amplitude $\mathrm{Q}=$ $0.405(5), \phi=273.7(5)$ and the pseudo rotation parameters are $\rho=76.0(3), \tau \mathrm{m}=42.0(3)$ for reference bond $\mathrm{N} 23-\mathrm{C} 24$.

Both the phenyl rings substituted at pyrrole N 1 , and at carbon C3 are planar with maximum deviation of 0.010(3) $\AA$ for C11 and $0.006(5) \AA$ for C20 atom respectively.

Torsional angle C4-C5-N23-C27 (-179.1(3) ${ }^{\circ}$ ) confirms a very much extended conformation for the pyrrolidine ring which is rotated out by $37.63(19)^{\circ}$ to the central system whereas Chloro-phenyl ring shares the plane of central ring (dihedral angle is $14.91(13)^{\circ}($ Table. 8)) thereby making feasible an intramolecular interaction involving C11-H11 with N8 of pyrimidine ring of $2.926(4) \AA$. Chlorine shares the plane of respective phenyl ring (deviation $0.048(1) \AA$ ). The phenyl ring substituted at C 3 of the pyrrole twisted out maximum $50.50(15)^{\circ}$ of the plane of the fused ring system thereby keeping away itself from taking part in any kind of intermolecular interactions.

There is a lack of even non-conventional hydrogen bond interactions in the molecular structure. However, only one intermolecular interactions responding to the structure stability is a direction specific $\pi \ldots \pi$ interaction (Fig. 4) involving centroids of pyrimidine and symmetry related pyrrole ring. Intramolecular and comparatively weak $\mathrm{C}-\mathrm{H} . . . \mathrm{N}$ hydrogen bond (Fig. 5) exist with C11-H11, acting as donor to pyrimidine nitrogen N 8 , a pseudo six membered ring of graph set motif $\mathrm{S}(6)$ [17]. The molecules are arranged in a zigzag chain along c axis. The chains are cross-linked through $\pi \ldots \pi$ stacking interactions along b axis between two symmetry related pyrimidine and pyrrole ring with $\mathrm{Cg} 3-\mathrm{Cg} 1(\mathrm{i})$ distance of $3.8641(9) \AA$ with a slippage of $1.09 \AA . \mathrm{Cg} 3$ is the centroid of $\mathrm{C} 4-\mathrm{C} 5-\mathrm{N} 6-\mathrm{C} 7-$ $\mathrm{N} 8-\mathrm{C} 9$ ring and Cg 1 is $\mathrm{N} 1-\mathrm{C} 2-\mathrm{C} 3-\mathrm{C} 4-\mathrm{C} 9$ ring centroid. The symmetry code is $(-1 / 2+x, 1-y, z) . \pi \ldots \pi$ stacked molecules led to formation of layer parallel to plane. The molecule arranged sinusoidally along c axis, where inactive halogen Chloride positioned itself at the boundary and the centre of the unit cell forming a column along b axis. Chlorine-Chlorine distance is $5.3119(14) \AA$. Only two significant van der Waal distances < $3.6 \AA$ could be observed in the structure indicating a very weak molecular packing (Table. 9).

Table 8. Dihedral angles

| Plane | Plane | Angle( ${ }^{0}$ ) |
| :--- | :--- | :--- |
| $1\left(N_{1}-C_{2}-C_{3}-C_{4}-C_{9}\right)$ | $3\left(C_{4}-C_{5}-N_{6}-C_{7}-N_{8}-C_{9}\right)$ | $6.23(17)$ |
| $6\left(N_{1}-C_{2}-C_{3}-C_{4}-C_{5}-N_{6}-C_{7}-N_{8}-C_{9}\right)$ | $4\left(C_{10}-C_{11}-C_{12}-C_{13}-C_{14}-C_{15}\right)$ | $14.91(13)$ |
| $6\left(N_{1}-C_{2}-C_{3}-C_{4}-C_{5}-N_{6}-C_{7}-N_{8}-C_{9}\right)$ | $5\left(C_{17}-C_{18}-C_{19}-C_{20}-C_{21}-C_{22}\right)$ | $50.50(15)$ |
| $6\left(N_{1}-C_{2}-C_{3}-C_{4}-C_{5}-N_{6}-C_{7}-N_{8}-C_{9}\right)$ | $2\left(N_{23}-C_{24}-C_{25}-C_{26}-C_{27}\right)$ | $37.63(19)$ |

Table 9
(A) $\pi \ldots \pi$ stacking interaction

| $\mathbf{C g}(\mathbf{I})$ | $\mathbf{C g}(\mathbf{J})$ | $\mathbf{C g}(\mathbf{I}) \ldots \mathbf{C g}(\mathbf{J}) \AA$ | $\mathbf{C g}(\mathbf{I}) \ldots \mathbf{P} \AA$ | $\boldsymbol{\alpha}$ | $\boldsymbol{\gamma}$ | $\Delta \AA$ |
| :---: | :---: | :---: | :--- | :--- | :--- | :--- |
| 1 | 3 | $3.8641(19)$ | 3.650 | 2.85 | 19.14 | 1.26 |

(B)Intramolecular Hydrogen bonding interactions

| D-H...A | D-H $\AA$ | $\mathbf{D} \ldots \mathbf{A} \AA$ | $\mathbf{H} \ldots \mathbf{A} \AA$ | $\angle \mathbf{D}-\mathbf{H} \ldots \mathbf{A}\left({ }^{\circ}\right)$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{C}_{11}-\mathrm{H}_{11 \ldots} . . \mathrm{N}_{8}$ | 0.92 | $2.926(4)$ | $2.29(3)$ | $126(2)$ |

(C)Short contact distances $<\mathbf{3 . 6 \AA}$

| Atoms | Distance $\AA$$\AA$ Atoms Distance $\AA^{\mathbf{\AA}}$ |  |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{C}_{2}-\mathrm{C}_{15} \mathrm{i}$ | $3.549(5)$ | $\mathrm{C}_{7}-\mathrm{C}_{14} \mathrm{ii}$ | $3.573(5)$ |

(D)Equivalent points
0)

$$
\mathrm{x} \text { y z }
$$

i)

$$
1 / 2+x, \quad 1-y, z
$$

ii) $\quad 1 / 2-x, y, 1 / 2+z$

Fig 4. Part of Molecular Packing showing $\pi \ldots \pi$ interactions with dash lines

Fig 5. Part of Molecular Packing showing C-H...N intramolecular interactions with dash lines Supplementary data

The Crystallographic Information File (cif) for the structure reported in this paper has been deposited with Cambridge Crystallographic Data Center CCDC, 12 Union Road, Cambridge CB2 1EZ, UK (fax: +44 1223 336033; e-mail: deposit@ccdc.cam.ac.uk or http://www.ccdc.cam.ac.uk) as supplementary publication no. CCDC $897812\left(\mathrm{C}_{22} \mathrm{H}_{19} \mathrm{ClN}_{4}\right)$. A Copy of the data may be obtained free of charge on application to above address.

## Acknowledgment

Authors are thankful to Department of Physics, Sardar Patel University, Vallabh Vidyanagar for providing the financial support to carry out the work and to CSMCRI, Bhavnagar for intensity data collection of the crystal. BDP is thankful to M. B. Patel Science College, Anand for giving necessary permission to carry out the research work.
