ABSTRACT

An exact solution of unsteady flow past an exponentially accelerated infinite isothermal vertical plate with variable temperature and uniform mass diffusion in the presence of chemical reaction of first order has been studied. The plate temperature is raised linearly with respect to time and concentration level near the plate is raised uniformly. The dimensionless governing equations are solved using the Laplace-transform technique. The velocity, temperature and concentration profiles are studied for different physical parameters like magnetic field parameter, chemical reaction parameter, thermal Grashof number, mass Grashof number, Schmidt number, time and a . It is observed that the velocity decreases with increasing magnetic field parameter.

Introduction

Magnetoconvection plays an important role in agriculture, petroleum industries, geophysics and in astrophysics. Important applications in the study of geological formations, in exploration and thermal recovery of oil, and in the assessment of aquifers, geothermal reservoirs and underground nuclear waste storage sites. MHD flow has application in metrology, solar physics and in motion of earth's core. Also it has applications in the field of stellar and planetary magnetospheres, aeronautics, chemical engineering and electronics. The effects of transversely applied magnetic field, on the flow of an electrically conducting fluid past an impulsively started infinite isothermal vertical plate was studied by Soundalgekar et al [1]. MHD effects on impulsively started vertical infinite plate with variable temperature in the presence of transverse magnetic field were studied by Soundalgekar et al [2]. MHD effects on flow past an infinite vertical plate for both the classes of impulse as well as accelerated motion of the plate was studied by Raptis and Singh [3]. The dimensionless governing equations were solved using Laplace transform technique.

Free convection effects on flow past an exponentially accelerated vertical plate was studied by Singh and Naveen Kumar [4]. The skin friction for accelerated vertical plate has been studied analytically by Hossain and Shayo [5]. Gupta [6] studied flow of an electrically conducting fluid near an uniformly accelerated vertical plate in the presence of uniform magnetic field. Raptis et al [7] discussed MHD flow past an accelerated vertical plate with variable suction and heat flux. Singh [8] analyzed MHD flow past an exponentially accelerated vertical plate with uniform temperature.

The Effect of a chemical reaction depends whether the reaction is homogeneous or heterogeneous. This depends on whether they occur at an interface or as a single phase volume reaction. In well-mixed systems, the reaction is heterogeneous, if it takes place at an interface and homogeneous, if it takes place in solution. Chambre and Young [9] analyzed a first order chemical reaction in the neighbourhood of a horizontal plate. Das et al. [10] have studied the effect of homogeneous first order chemical reaction on the flow past an impulsively started infinite vertical plate with uniform heat flux and mass transfer. Again, mass transfer effects on moving isothermal vertical plate in the presence of chemical reaction studied by Das et al. [11]. The dimensionless governing equations were solved by the usual Laplace-transform technique and the solutions are valid only at lower time level.

Hence it is proposed to study the effects on unsteady MHD flow past an exponentially accelerated infinite isothermal vertical plate with variable temperature and uniform mass diffusion, in the presence of homogeneous chemical reaction of first order. The dimensionless governing equations are solved using the Laplace-transform technique. The solutions are in terms of exponential and complementary error function. Such a study found useful in magnetic control of molten iron flow in the steel industry, liquid metal cooling in nuclear reactors and magnetic suppression of molten semi-conducting materials.

Mathematical Formulation

Here the unsteady flow of a viscous incompressible fluid past an infinite isothermal vertical plate with uniform mass diffusion in the presence of magnetic field has been considered. The x' -axis is taken along the plate in the vertically upward

direction and the y' -axis taken normal to the plate. A transverse magnetic field of uniform strength B_0 is assumed to be applied normal to the plate. The induced magnetic field and viscous dissipation is assumed to be negligible. At time $t' \leq 0$ the plate and fluid are at the same temperature T_∞ . At time $t' > 0$, the plate is exponentially accelerated with a velocity $u = u_0 \exp(a't')$ in its own plane and the temperature from the plate is raised linearly with respect to time and the concentration level near the plate is raised to C'_w and the mass is diffused from the plate to the fluid uniformly. A transverse magnetic field of uniform strength B_0 is assumed to be applied normal to the plate. It is assumed that the effect of viscous dissipation is negligible in the energy equation and there is a first order chemical reaction between the diffusing species and the fluid. Then under usual Boussinesq's approximation the unsteady flow is governed by the following equations:

$$\frac{\partial u}{\partial t'} = g\beta(T - T_\infty) + g\beta^*(C' - C'_\infty) + \nu \frac{\partial^2 u}{\partial y'^2} - \frac{\sigma B_0^2}{\rho} u \quad (1)$$

$$\rho C_p \frac{\partial T}{\partial t'} = k \frac{\partial^2 T}{\partial y'^2} \quad (2)$$

$$\frac{\partial C'}{\partial t'} = D \frac{\partial^2 C'}{\partial y'^2} - k_1 C' \quad (3)$$

In most cases of chemical reactions, the rate of reaction depends on the concentration of the species itself. A reaction is said to be of the order n , if the reaction rate is proportional to the n^{th} power of the concentration. In particular, a reaction is said to be first order, if the rate of reaction is directly proportional to concentration itself.

with the following initial and boundary conditions:

$$\begin{aligned} u = 0, \quad T = T_\infty, \quad C' = C'_\infty \quad \text{for all } y, t' \leq 0 \\ t' > 0: u = u_0 \exp(a't'), \quad T = T_\infty + (T_w - T_\infty)At', \quad C' = C'_w \quad \text{at } y = 0 \\ u \rightarrow 0, \quad T \rightarrow T_\infty, \quad C' \rightarrow C'_\infty \quad \text{as } y \rightarrow \infty \end{aligned} \quad (4)$$

Where, $A = \frac{u_0^2}{\nu}$.

On introducing the following non-dimensional quantities:

$$\begin{aligned} U = \frac{u}{u_0}, \quad t = \frac{t'u_0^2}{\nu}, \quad Y = \frac{yu_0}{\nu}, \quad \theta = \frac{T - T_\infty}{T_w - T_\infty}, \\ Gr = \frac{g\beta\nu(T_w - T_\infty)}{u_0^3}, \quad C = \frac{C' - C'_\infty}{C'_w - C'_\infty}, \quad Gc = \frac{\nu g\beta^*(C'_w - C'_\infty)}{u_0^3}, \end{aligned} \quad (5)$$

$$Pr = \frac{\mu C_p}{k}, \quad a = \frac{a'\nu}{u_0^2}, \quad Sc = \frac{\nu}{D}, \quad M = \frac{\sigma B_0^2 \nu}{\rho u_0^2}, \quad K = \frac{Vk_1}{u_0^2}$$

in equations (1)-(4), leads to

$$\frac{\partial U}{\partial t} = Gr\theta + GcC + \frac{\partial^2 U}{\partial Y^2} - MU \quad (6)$$

$$\frac{\partial \theta}{\partial t} = \frac{1}{Pr} \frac{\partial^2 \theta}{\partial Y^2} \quad (7)$$

$$\frac{\partial C}{\partial t} = \frac{1}{Sc} \frac{\partial^2 C}{\partial Y^2} - KC \quad (8)$$

The negative sign of K in the last term of the equation (8) indicates that the chemical reaction takes place from higher level of concentration to lower level of concentration.

The initial and boundary conditions in non-dimensional quantities are

$$\begin{aligned} U = 0, \quad \theta = 0, \quad C = 0 \quad \text{for all } Y, \quad t \leq 0 \quad (9) \\ t > 0: U = \exp(at), \quad \theta = t, \quad C = 1 \quad \text{at } Y = 0 \\ U \rightarrow 0, \quad \theta \rightarrow 0, \quad C \rightarrow 0 \quad \text{as } Y \rightarrow \infty \end{aligned}$$

Solution Procedure

The solutions are in terms of exponential and complementary error function. The relation connecting error function and its complementary error function is as follows:

$$\operatorname{erfc}(x) = 1 - \operatorname{erf}(x)$$

The dimensionless governing equations (6)-(8), subject to the boundary conditions (9), are solved by the usual Laplace-transform technique and the solutions are derived. The solutions are in terms of exponential and complementary error function. The relation connecting error function and its complementary error function is as follows:

$$\operatorname{erfc}(x) = 1 - \operatorname{erf}(x)$$

$$\theta = t \left[(1 + 2\eta^2 Pr) \operatorname{erfc}(\eta\sqrt{Pr}) - 2\eta\sqrt{\frac{Pr}{\pi}} \exp(-\eta^2 Pr) \right] \quad (10)$$

$$C = \frac{1}{2} \left[\exp(2\eta\sqrt{KtSc}) \operatorname{erfc}(\eta\sqrt{Sc} + \sqrt{Kt}) + \exp(-2\eta\sqrt{KtSc}) \operatorname{erfc}(\eta\sqrt{Sc} - \sqrt{Kt}) \right] \quad (11)$$

$$\begin{aligned} U = \frac{\exp(at)}{2} \left[\exp(2\eta\sqrt{(M+a)t}) \operatorname{erfc}(\eta + \sqrt{(M+a)t}) \right. \\ \left. + \exp(-2\eta\sqrt{(M+a)t}) \operatorname{erfc}(\eta - \sqrt{(M+a)t}) \right] \\ + [e + d(1 + bt)] \left[\exp(2\eta\sqrt{Mt}) \operatorname{erfc}(\eta + \sqrt{Mt}) + \exp(-2\eta\sqrt{Mt}) \operatorname{erfc}(\eta - \sqrt{Mt}) \right] \\ - \frac{bd\eta\sqrt{t}}{\sqrt{M}} \left[\exp(-2\eta\sqrt{Mt}) \operatorname{erfc}(\eta - \sqrt{Mt}) - \exp(2\eta\sqrt{Mt}) \operatorname{erfc}(\eta + \sqrt{Mt}) \right] \\ - d \exp(bt) \left[\exp(2\eta\sqrt{(M+b)t}) \operatorname{erfc}(\eta + \sqrt{(M+b)t}) \right. \\ \left. + \exp(-2\eta\sqrt{(M+b)t}) \operatorname{erfc}(\eta - \sqrt{(M+b)t}) \right] - 2d \operatorname{erfc}(\eta\sqrt{Pr}) \\ - e \cdot \exp(ct) \left[\exp(2\eta\sqrt{(M+c)t}) \operatorname{erfc}(\eta + \sqrt{(M+c)t}) \right. \\ \left. + \exp(-2\eta\sqrt{(M+c)t}) \operatorname{erfc}(\eta - \sqrt{(M+c)t}) \right] \\ - 2bdt \left[(1 + 2\eta^2 Pr) \operatorname{erfc}(\eta\sqrt{Pr}) - \frac{2\eta\sqrt{Pr}}{\sqrt{\pi}} \exp(-\eta^2 Pr) \right] \\ + d \exp(bt) \left[\exp(2\eta\sqrt{Prbt}) \operatorname{erfc}(\eta\sqrt{Pr} + \sqrt{bt}) \right. \\ \left. + \exp(-2\eta\sqrt{Prbt}) \operatorname{erfc}(\eta\sqrt{Pr} - \sqrt{bt}) \right] \\ - e \left[\exp(2\eta\sqrt{KtSc}) \operatorname{erfc}(\eta\sqrt{Sc} + \sqrt{Kt}) \right. \\ \left. + \exp(-2\eta\sqrt{KtSc}) \operatorname{erfc}(\eta\sqrt{Sc} - \sqrt{Kt}) \right] \\ + e \exp(ct) \left[\exp(2\eta\sqrt{Sc(K+c)t}) \operatorname{erfc}(\eta\sqrt{Sc} + \sqrt{(K+c)t}) \right. \\ \left. + \exp(-2\eta\sqrt{Sc(K+c)t}) \operatorname{erfc}(\eta\sqrt{Sc} - \sqrt{(K+c)t}) \right] \end{aligned} \quad (12)$$

$$\text{where } b = \frac{M}{(Pr-1)}, \quad c = \frac{M-KSc}{(Sc-1)}, \quad d = \frac{Gr}{2b^2(1-Pr)}, \quad e = \frac{Gc}{2c(1-Sc)}$$

$$\text{and } \eta = \frac{Y}{2\sqrt{t}}.$$

Discussion of Results

For physical understanding of the problem numerical computations are carried out for different physical parameters M , a , Gr , Gc , K , Sc and t upon the nature of the flow and transport. The value of Prandtl number Pr is chosen such that they represent water ($Pr = 7.0$). The numerical values of the velocity are computed for different physical parameters like magnetic field parameter, chemical reaction parameter, a ,

Prandtl number, thermal Grashof number, mass Grashof number, Schmidt number and time.

The velocity profile for different values of time $t = \{0.2, 0.4, 0.6, 0.8\}$, $Sc = 0.6$, $Gr = Gc = 5$, $M = 0.2$, $K = 5$ and $a = 1$ are shown in Figure 1. It is observed that velocity increases with increasing values of the time.

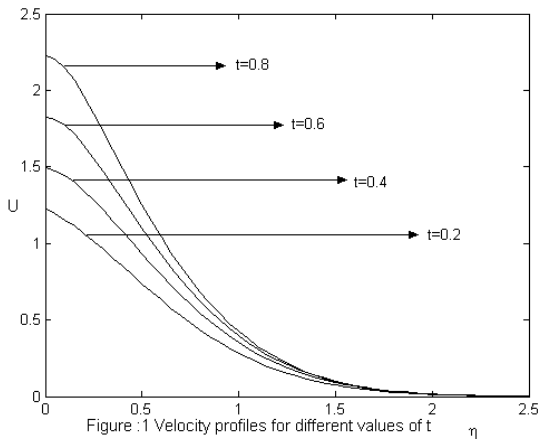

Figure :1 Velocity profiles for different values of t

The velocity profile for different values $a = \{0.2, 0.5, 1\}$, $Sc = 0.6$, $Gr = Gc = 5$, $M = 0.2$, $t = 0.2$ and $K = 5$ are studied and presented in Figure 2. It is observed that the velocity increases with increasing values of a .

Figure :2 Velocity profiles for different values of a

Figure 3 demonstrates effects of the magnetic field parameter on the velocity when $M = 0.2, 2, 5$, $Sc = 0.6$, $Gr = Gc = 5$, $t = 0.2$, $K = 5$ and $a = 0.2$. It is observed that velocity increases with decreasing magnetic field parameter.

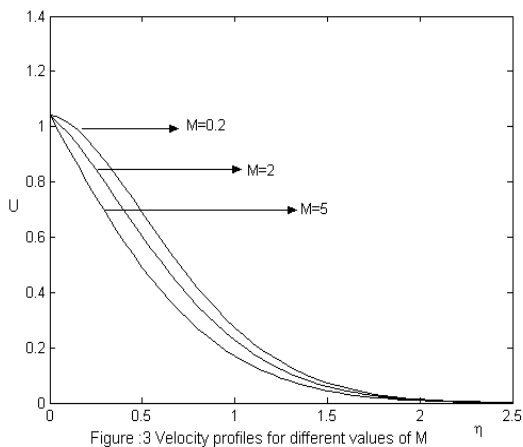

Figure :3 Velocity profiles for different values of M

Figure 4 represents the effect of temperature profiles for different values of $(t = 0.2, 0.4, 0.6, 1)$, $Pr = 7$. It is observed that the temperature increases with increasing values of time ' t '.

Figure :4 Temperature profiles for different values of t

Figure 5 represents the effect of velocity profiles for different value of the chemical reaction parameter ($K = 2, 5, 10$), $Gr = Gc = 5$, $a = 1$, $Sc = 0.6$, $M = 0.4$ and $t = 0.4$. It is observed that velocity increases with decreasing values of chemical reaction parameter.

Figure:5 Velocity profiles for different values of K

Figure 6 represents the effect of concentration profiles for different values of the Schmidt number ($Sc = 0.3, 0.6, 2.01$), $t = 1$ and $K = 0.2$. It is observed that the concentration increases with decreasing Schmidt number.

Figure:6 Concentration profiles for different values of Sc

Conclusions

An exact analysis of hydromagnetic flow past an exponentially accelerated infinite vertical plate with variable temperature and uniform mass diffusion in the presence of

chemical reaction of first order has been studied. The dimensionless governing equations are solved by the usual Laplace-transform technique. The effect of different parameters like magnetic field parameter, chemical reaction parameter, thermal Grashof number, mass Grashof number and time(t) are studied graphically. The conclusions of the study are as follows:

- (i) The velocity decreases with increasing magnetic field parameter M (or) chemical reaction parameter.
- (ii) The velocity increases with increasing values time t in the presence of magnetic field parameter.
- (iii) The wall concentration increases with decreasing chemical reaction parameter or Sc .
- (iv) The temperature increases with increasing values of time ' t '.
