Subdivision graph.

### ABSTRACT

A set of vertices  $D$  in a graph  $G = (V, E)$  is a dominating set if every vertex of  $V - D$  is adjacent to some vertex of  $D$ . If  $D$  has the smallest possible cardinality of any dominating set of  $G$ , then  $D$  is called a minimum dominating set. A graph  $G$  is said to be Just excellent (JE), if it to each  $u \in V$ , there is a unique  $\gamma$ -set of  $G$  containing  $u$ . In this paper we have obtained the domestic number of the subdivision graph of a just excellent graph.

### Introduction

We consider only simple connected undirected graphs  $G = (V, E)$ . The subgraph of  $G$  induced by the vertices in  $D$  is denoted by  $\langle D \rangle$ .  $C_n, K_n$  denotes the cycle and complete graph with  $n$  vertices respectively, and  $P_n$  is a path of length  $n$ . The open neighborhood of vertex  $v \in V(G)$  is denoted by  $N(v) = \{u \in V(G) \mid (u, v) \in E(G)\}$  while its closed neighborhood is the set  $N[v] = N(v) \cup \{v\}$ . The private neighborhood of  $v \in D$  is denoted by  $pn[v, D]$ , is defined by  $pn[v, D] = N(v) - N(D - \{v\})$ . We indicate that  $u$  is adjacent to  $v$  by writing  $u \perp v$ .

Let  $S$  be a given set and  $A = \{A_1, A_2, \dots, A_m\}$ . If each  $A_i, i = 1, 2, \dots, m$  is a subset of  $S, A_1 \cup A_2 \cup \dots \cup A_m = S, A_i \cap A_j = \emptyset, i \neq j, i, j = 1, 2, \dots, m$ , then the set  $A$  is called a partition of  $S$ . A subdivision of a graph  $G$  is a graph resulting from the subdivision of edges in  $G$ . The subdivision of some edge  $e$  with endpoints  $\{u, v\}$  yields a graph containing one new vertex  $w$ , and with an edge set replacing  $e$  by two new edges,  $\{u, w\}$  and  $\{w, v\}$ . We shall denote the graph obtained by subdividing any edge  $uv$  of a graph  $G$ , by  $G_{sd} uv$ . Let  $w$  be a vertex introduced by subdividing  $uv$ . We shall denote this by  $G_{sd} uv = w$ .

A set of vertices  $D$  in a graph  $G = (V, E)$  is a dominating set if every vertex of  $V - D$  is adjacent to some vertex of  $D$ . If  $D$  has the smallest possible cardinality of any dominating set of  $G$ , then  $D$  is called a minimum dominating set — abbreviated MDS. The cardinality of any MDS for  $G$  is called the domination number of  $G$  and it is denoted by  $\gamma(G)$ . A  $\gamma$ -set denotes a dominating set for  $G$  with minimum cardinality. A vertex  $v$  is said to be a, down vertex if  $\gamma(G - u) < \gamma(G)$ , level vertex if  $\gamma(G - u) = \gamma(G)$ , up vertex if  $\gamma(G - u) > \gamma(G)$ . A vertex in  $V - D$  is  $k$ -dominated if it is dominated by at least  $k$  - vertices in  $D$ .

The concept of the domestic number was introduced by Cockayne and Hedetniemi in 1977. A domestic partition of a graph  $G = (V, E)$  is a partition of  $V$  into disjoint sets  $V_1, V_2, \dots, V_k$  such that each  $V_i$  is a dominating set for  $G$ . The domestic number is the maximum number of such disjoint sets and it is denoted by  $d(G)$ .

A vertex  $v$  is said to be good if there is a  $\gamma$ -set of  $G$  containing  $v$ . A graph  $G$  is said to be excellent if every vertex of  $G$  is good. In [6] M. Yamuna and N. Sridharan, had defined a graph  $G$  to be Just excellent (JE), if it to each  $u \in V$ , there is a unique  $\gamma$ -set of  $G$  containing  $u$ .

### Example

Fig. 1

In Fig. 1,  $G$  is a JE graph and  $\{1, 4, 7\}, \{2, 5, 8\}$  and  $\{3, 6, 9\}$  are the distinct  $\gamma$ -sets for  $G$ .

In [6], they have proved the following results

- A graph  $G$  is JE if and only if,
  - $\gamma(G)$  divides  $n$ .
  - $d(G) = n / \gamma(G)$ , where  $d(G)$  denotes the domestic partition of  $G$ .
  - $G$  has exactly  $n / \gamma(G)$  distinct  $\gamma$ -sets.
- If  $G \neq \overline{K_n}$  is JE then  $|PN(u, D)| \geq 2$  for each vertex  $u \in D$ , where  $D$  is any  $\gamma$ -set of  $G$ .

If the condition (2) is not satisfied, then the graph is not JE.

In [4] the following result has been proved.

- A JE graph has no down vertex.

In this paper we obtain the domestic number of subdivision graph of a just excellent graph. The domestic number of subdivision graph is denoted by  $d(G_{sd} uv)$ , for all  $u, v \in V(G), u \perp v$ .

We already have proved the following result,

4. Let  $G$  be any graph. Then  $d(G_{sd} uv) \leq 3$ .

**Theorem 1**

Let  $G$  be a JE graph such that  $d(G) \leq 3$ . Then  $G$  has no 2-dominated vertex.

**Proof**

Since  $G$  is JE, we know that,

- i.  $\gamma(G)$  divides  $n$ .
- ii.  $d(G) = n / \gamma(G)$ .
- iii.  $G$  has exactly  $n / \gamma(G)$  distinct  $\gamma$ -sets.
- iv.  $|pn[u, D]| \geq 2$ , for all  $u \in D$ .

**Case i**  $d(G) = 3$

**Subcase i**

If  $\gamma(G) = 2$ , then by condition (ii),  $n = 6$ .

By condition (iii),  $d(G) = |\{V_1\}, \{V_2\}, \{V_3\}|$ ,  $|V_i| = 2$ ,  $i = 1, 2, 3$  and  $V_i, i = 1, 2, 3$  are  $\gamma$ -sets. Let  $V_i = \{x_i, y_i\}, i = 1, 2, 3$ .

By condition (iv),  $pn[x_i] \geq 2$  and  $pn[y_i] \geq 2, i = 1, 2, 3$ .

$|V - \{V_i\}| = 4, i = 1, 2, 3$ , which implies every element in  $V - D$  is private neighborhood of some elements in  $V_i$ . In this case,  $G$  has no 2-dominated vertex.

**Subcase ii**

If  $\gamma(G) = 3$ , then by condition (ii),  $n = 9$ .

As in subcase - i,  $d(G) = |\{V_1\}, \{V_2\}, \{V_3\}|$ , where  $|V_i| = 3, i = 1, 2, 3$  and  $V_i, i = 1, 2, 3$  are  $\gamma$ -sets. Let  $V_i = \{x_i, y_i, z_i\}, i = 1, 2, 3$ .

By condition (iv),  $pn[x_i] \geq 2, pn[y_i] \geq 2$  and  $pn[z_i] \geq 2, i = 1, 2, 3$ .

$|V - \{V_i\}| = 6, i = 1, 2, 3$ , which implies every element in  $V - D$  is private neighborhood of some elements in  $V_i$ . In this case,  $G$  has not 2-dominated vertex.

By subcase - i and ii, we observe that, when  $d(G) = 3$ , as the value of  $\gamma$  is increased by 1, the value of  $n$  increases by 3. Also  $|V - V_i| = 2|V_i|, i = 1, 2, 3$ , which implies, if  $G$  is JE such that  $d(G) = 3$ , then  $G$  has no 2-dominated vertex.

**Case ii**  $d(G) = 2$

**Subcase i**

If  $\gamma(G) = 2$ , then by condition (ii),  $n = 4$ .

By condition (iii),  $d(G) = |\{V_1\}, \{V_2\}|, |V_i| = 2, i = 1, 2$ .

By condition (iv),  $pn[u, D] \geq 2$ , for any  $u \in D$ . Also if this condition is not satisfied, then  $G$  is not JE.  $|V - V_i| = 2$ , which implies  $pn[u, D] \geq 2$ , for every  $u \in D$  is not possible.

If  $d(G) = \gamma(G) = 2$ , then  $G$  is not JE.

**Subcase ii**

If  $\gamma(G) = 3$ , then by condition (ii),  $n = 6$ .

By condition (iii),  $d(G) = |\{V_1\}, \{V_2\}|, |V_i| = 3, i = 1, 2$ . Since  $|V_1| = |V_2|$ , each  $u \in V_i$  can have atmost one private neighborhood, that is  $pn[u, D] < 2$ , for each vertex  $u \in D$ .

If  $d(G) = 2$  and  $\gamma(G) = 3$ , then  $G$  is not JE.

From the above discussion, in case - ii, we observe that if  $d(G) = 2$ , as the value of  $\gamma$  is increased by 1, the value of  $n$  increases by 2. Also  $|V - V_i| = |V_i|, i = 1, 2$ . So when  $d(G) = 2$ , it is not possible that  $pn[u, D] \geq 2$ . This implies that, if  $d(G) = 2$ , then  $G$  is not JE. Also for any graph  $G, d(G) \geq 2$ . [ Since  $d(G) = |V, V - D|$  is always possible for any  $\gamma$ -set  $D$  for  $G$  ].

Hence we conclude that, if  $G$  is JE and  $d(G) \leq 3$ , then  $G$  has no 2-dominated vertex.  $\square$

**Corollary 1**

If  $G$  is JE,  $d(G) \leq 3$ , then every vertex in  $V - D$  is a private neighborhood.

**Remark**

If  $G$  is JE,  $d(G) > 3$ , then it is possible that  $G$  has a 2-dominated vertex.

**Example**

**Fig. 2**

In Fig. 2,  $G$  is a JE graph and  $d(G) = |\{1, 2\}, \{3, 8\}, \{4, 7\}, \{5, 6\}| = 4$ . Vertex 6 is 2 dominated vertex, with respect to  $\{1, 2\}$  as shown in the figure.

**Corollary 2**

There is no JE graph  $G$  such that  $d(G) = 2$ .

**Proof**

If possible assume that  $d(G) = 2$ , where  $G$  is JE.

If  $\gamma(G) = 2$ , then  $G$  is not JE as in subcase i of case ii.

If  $\gamma(G) = m, m \geq 3$ , then  $n = 2m$ . Let  $d(G) = |\{V_1\}, \{V_2\}|, |V_i| = m, i = 1, 2$ . Since  $|V_1| = |V_2|$ , each  $u \in V_i$  can have atmost one private neighborhood as in subcase ii of case ii, that is  $pn[u, D] < 2$ , for each vertex  $u \in D$ , which implies  $G$  is not JE.

In general, there is no JE graph  $G$  such that  $d(G) = 2$ .

**Theorem 2**

In a JE graph every vertex is a level vertex.

**Proof**

Let  $G$  be a JE graph and let  $u \in V(G)$ .

**Case i**  $u$  is not a down vertex

By result [ 3 ], we know that a JE graph does not contain a down vertex.

**Case ii**  $u$  is not an up vertex

**Claim**

If  $u$  is an up vertex for a graph  $G$ , then  $u$  must be included in every possible  $\gamma$ -set.

**Proof**

If there is a  $\gamma$ -set for  $G$  not containing  $u$ , then  $D$  is a dominating set for  $G - \{u\}$  also, that is  $\gamma(G - u) = \gamma(G)$ , which is a contradiction as  $u$  is an up vertex [ If  $u$  is an up vertex, then  $\gamma(G - u) > \gamma(G)$  ]. This implies that, an up vertex must be included in every possible  $\gamma$ -set.

By the above claim, if  $u$  is an up vertex, then  $u$  must be included in every possible  $\gamma$ -set, a contradiction as  $G$  is JE.

Hence, from case - i and ii, we conclude that, in a JE graph every vertex is a level vertex.  $\square$

In [ 5 ], M. Yamuna and K. Karthika introduced the concept of domination subdivision stable graph. A graph  $G$  is said to be domination subdivision stable (DSS), if the  $\gamma$ -value of  $G$  does not change by subdividing any edge of  $G$ .

**Example**

**Fig. 3**

In Fig. 3,  $\gamma(G) = \gamma(G_{sd uv}) = 2$ . This is true for each  $e = (a, b) \in E(G)$ , which implies  $G$  is a DSS graph.

**Theorem 3**

Let  $G$  be a graph such that  $d(G) = |V_1, V_2, \dots, V_m|$ , where  $m \geq 3$  and  $|V_i| = \gamma(G)$ , for all  $i = 1, 2, \dots, m$ . If  $G$  is not DSS, then  $d(G_{sd uv}) < m$ .

**Proof**

Let  $G$  be a graph and  $d(G) = |V_1, V_2, \dots, V_m|$  such that  $|V_i| = \gamma(G)$ , for all  $i = 1, 2, \dots, m$ . In this case  $n = m \gamma(G)$ . If  $G$  is not DSS, then there is at least one  $u, v \in V(G)$ ,  $u \perp v$  such that  $\gamma(G_{sd uv}) = \gamma(G) + 1$ , that is

- i.  $|V(G_{sd uv})| = |V(G)| + 1$ .
- ii.  $|\gamma(G_{sd uv})| = \gamma(G) + 1$ .

If  $d(G_{sd uv}) = m$ , then  $|V(G_{sd uv})| \geq m(\gamma(G) + 1)$ ,  
 $\Rightarrow |V(G_{sd uv})| \geq m\gamma(G) + m$ .  
 $\Rightarrow |V(G_{sd uv})| \geq |V(G)| + m$ .

But by condition (i), we know that  $|V(G_{sd uv})| \neq |V(G)| + m$ , which implies  $d(G_{sd uv}) \neq m$ . Hence  $d(G_{sd uv}) < m$ .

**Theorem 4**

If  $G$  is just excellent, then  $G$  is not DSS.

**Proof**

Let  $G$  be just excellent. Let  $D$  be a  $\gamma$ -set for  $G$ . Let  $u \in D$  and let  $v \in pn[u, D]$ . There is one such  $v$ , since by result [2],  $pn[u, D] \geq 2$  for each vertex  $u \in D$  for a JE graph  $G$ . Let us assume that  $G$  is DSS.  $D$  does not dominate  $G_{sd uv}$ , since  $v$  is not dominated by  $D$ . If  $G_{sd uv}$  is DSS, then there is one  $\gamma$ -set  $D'$  for  $G_{sd uv}$ , such that  $|D'| = |D|$ .

**Case 1**  $u \in D', w, v \notin D'$

$D$  is a  $\gamma$ -set for  $G$ , where  $v \in pn[u, D]$ .  $D'$  is a  $\gamma$ -set for  $G$ , where  $v \notin pn[u, D']$ , that is  $D$  and  $D'$  are two distinct  $\gamma$ -set for  $G$  containing  $u$ , which is a contradiction.

**Case 2**  $w \in D'$  and  $u, v \notin D'$

$D'' = D' - \{w\} \cup \{v\}$  is a  $\gamma$ -set for  $G$ .

- 1. If  $pn[w, D'] = \emptyset$ , then  $pn[v, D''] = \emptyset$ .
- 2. If  $pn[w, D'] = 1 = v$ , then  $pn[v, D''] = \emptyset$ .
- 3. If  $pn[w, D'] = 2$ , then  $pn[v, D''] = 1$ .

In all cases, we get a contradiction, by result [2], we know that, since  $G$  is JE graph, then  $pn[u, D] \geq 2$ , for all  $u \in V(G)$ .

**Case 3**  $v \in D', u, w \notin D'$

$D''$  and  $D'$  are two distinct  $\gamma$ -sets for  $G$  containing  $v$ , which is a contradiction as  $G$  is JE.

**Case 4**  $u, w \in D', v \notin D'$

$D''' = D' - \{w\} \cup \{v\}$  is a  $\gamma$ -set for  $G$  containing  $u$ .  $D$  and  $D'''$  are two distinct  $\gamma$ -sets for  $G$  containing  $u$ , which is a contradiction as  $G$  is JE.

**Case 5**  $v, w \in D', u \notin D'$

$D^{iv} = D' - \{w\} \cup \{u\}$  is a  $\gamma$ -set for  $G$ .  $D$  and  $D^{iv}$  are two distinct  $\gamma$ -sets for  $G$  containing  $u$ , which is a contradiction as  $G$  is JE.

**Case 6**  $u, v \in D', w \notin D'$

$D'$  is a  $\gamma$ -set for  $G$  also that is  $D$  and  $D'$  are two distinct  $\gamma$ -sets for a containing  $u$ , which is a contradiction as  $G$  is JE.

In all cases we get a contradiction and hence  $G$  is not DSS.

**Conclusion**

By corollary [2] of theorem [1], we already know that there is no JE graph such that  $d(G) = 2$ . With this, and from the results so far proved we conclude the following about the domatic number of the subdivision of a just excellent graph.

**Theorem 5**

If  $G$  is JE, then  $d(G_{sd uv}) = 2$ , if  $d(G) = 3$  and  $d(G_{sd uv}) \leq 3$ , if  $d(G) \geq 4$ .

**Proof**

If  $G$  is JE such that  $d(G) = 3$ . Let  $d(G) = |\{V_1\}, \{V_2\}, \{V_3\}|$ , then by theorem [1], we know that,

- i.  $G$  has no 2-dominated vertex. Also since  $G$  is JE,
- ii.  $|V_i| = \gamma(G)$ .
- iii.  $n = 3\gamma(G)$ .
- iv.  $G$  is not DSS, by theorem [4].

By theorem [3], we conclude that  $d(G_{sd uv}) \neq 3$ . Hence  $d(G_{sd uv}) = 2$ .

If  $d(G) \geq 4$ , then by result [4],  $d(G_{sd uv}) \leq 3$ .
