DTML,
Mathematical, Conversion factor.

#### Abstract

Conversion within quantities of same units and between quantities of different units is a thorny subject to students of Jasikan College of Education (Butterfield, Sutherland \& Molyneux-Hodgson, 2000) and its treatment by tutors sometimes becomes very difficult such that most tutors resort to handling the subject theoretically/ abstractly. When this happens most students seemed not to comprehend the subject. In view of this, the DTML-Conversion model (i.e. D-Conversion model, T-Conversion model, M-Conversion model and the L-Conversion model) was designed. The DTMLConversion Model is a model that has been designed by the researcher to make the teaching of conversion in measurement very easy to tutors and meaningful to students. The DTMLConversion Model was tested on first year students of Jasikan College of Education. The researcher tested the DTML-Conversion model on 150 first year students in Jasikan College of Education by first teaching conversion using the traditional method which is the Conversion-factor for distance, time, mass and litre for a period of one month. A test was administered, collected and recorded, after which the DTML-Conversion model was introduced with similar test items. Comparison of the two test results showed that, students seemed to comprehend conversion in measurement with the DTML-Conversion model to the conversion-factor method.

## Introduction

The DTML-Conversion Model is a model that has been designed by the researcher to make the teaching of conversion in measurement very easy to tutors and meaningful to students. This employs the use of a straight line divided into equal sections/parts depending on the physical quantity of concern. The three fundamental/basic physical quantities which are used in this model are distance, time and mass coupled with one derived quantity i.e. the Litre (Volume in Fluids).

Conversion within quantities of same units and between quantities of different units is a thorny subject to students (Butterfield, Sutherland \& Molyneux-Hodgson, 2000) and its treatment by tutors sometimes becomes very difficult such that tutors resort to handling the subject theoretically/ abstractly. When this happens most students seemed not to comprehend the subject.

In view of this, Trimpe, 2000 \& 2008 and http://www.bayhicoach.com designed a metric mania and metric conversion: stair-step method to enable students understands conversion of distance, litre and grams. Trimpe metric mania and the stair-step method even though very similar were good; however, it concentrated on only one dimension distance (i.e. considering distance) and just one aspect of the three dimension distance i.e. litre, while the DTML-Conversion extends from one distance dimension to two distance dimension and three distance dimension (i.e. considering distance in concern) and also each step in the metric mania is in multiples of decimals (i.e. 0.1) when dealing with smaller units of the basic unit and in multiples of ten (i.e. 10) when dealing with higher units also of the basic unit (Appendix A, and Appendix B) and also from http://www.bayhicoach.com that steps in metric system are all in multiples of ten. However, with the DTML-Conversion model,
some steps were in multiples of 10 i.e. distance, litre and mass units while that of time unit was in multiples of sixty. All units with the exception of the smallest unit (started with zero) on straight that started with ten steps each or sixty steps each, and also in place of the basic unit for both higher units and smaller as in metric mania and the stair-step have been replaced with the smallest unit and the highest unit on a straight line.

The DTML-Conversion model was designed by the researcher from the premise that learning to convert between units of measurement is critical to learners development in the realm of science and other courses and that having access to a general method would support students' efficiency in conversion (Butterfield, Sutherland \& Molyneux-Hodgson, 2000). The focus for designing the DTML-Conversion model was on the role of a general rule for converting and this arose out of a detailed observational study of first year diploma in basic education students of Jasikan College of Education working through their integrated science course on measurement (Molyneux \& Sutherland, 1996).

Conversions are an integral part of much scientific practice, for example to allow for ease of data processing, to enable comparison and standardization and to support the understanding of physical quantities and processes (Molyneux and Sutherland, 1996). It is therefore crucial for students to become competent in converting between units.

The researcher having interacted with students' of teacher training college and havong taught for six years in Jasikan College of Education, designed a model (i.e. DTML-Conversion model) that would make the teaching of the subject practical, real and meaningful to both students and tutors in Colleges of Education in Ghana and at any other level. The DTMLConversion model is much more an improved form of the metric
mania and the stair-step method (Trimpe, 2008; http://www.bayhicoach.com). The DTML-Conversion model has been tested on first year students of Jasikan College of Education. First year students of the college were used because measurement (Physics) was part of their Integrated Science Syllabus.

This version only presents the conceptual, practical aspects of the DTML-Conversion model coupled with its proven mathematical formulars. The next version of the DTMLConversion model will present the research findings of the use of the DTML-Conversion model on 2011/2012 first year diploma in basic education (DBE) students of Jasikan College of Education, Ghana.
Research Hypothesis

1. There is no significant statistical deference between the conversion-factor on length (one dimension distance) and the LConversion model on length (one dimension distance)
2. There is no significant statistical deference between the conversion-factor on area (two dimension distance) and the AConversion model on area (two dimension distance)
3. There is no significant statistical deference between the conversion-factor on volume (three dimension distance) and the V-Conversion model on volume (three dimension distance)
4. There is no significant statistical deference between the conversion-factor on mass and the M -Conversion model on mass
5. There is no significant statistical deference between the conversion factor on time and the T-Conversion model on time.
6. There is no significant statistical deference between the conversion factor on litre and the L-Conversion model on litre.
The conceptual and practical bases of the dtm-conversion model

## The Distance-Conversion Model

The distance-Conversion Model (D-Conversion Model) has three parts, which are one dimension distance (the LengthConversion Model), two dimension distance (the AreaConversion Model) and three dimension distance (the VolumeConversion Model).

A straight line is divided into six equal parts. The distance between each part is ten (10), hundred (100) and thousand (1000) depending on one's dimension.

Figure 1: The division of the straight line into equal parts of 10,100 and 1000.
Figure 1a

Figure 1b

Figure 1c

The straight lines are labelled $\left(\mathrm{mm}, \mathrm{mm}^{2}, \mathrm{~mm}^{3}\right),\left(\mathrm{cm}, \mathrm{cm}^{2}, \mathrm{~cm}^{3}\right)$, $\left(\mathrm{dm}, \mathrm{dm}^{2}, \mathrm{dm}^{3}\right),\left(\mathrm{m}, \mathrm{m}^{2}, \mathrm{~m}^{3}\right),\left(\mathrm{Dm}, \mathrm{Dm}^{2}, \mathrm{Dm}^{3}\right),\left(\mathrm{Hm}, \mathrm{Hm}^{2}, \mathrm{Hm}^{3}\right)$ and ( $\mathrm{Km}, \mathrm{Km}^{2}, \mathrm{Km}^{3}$ ).
$\mathrm{mm}=$ millimeter $\quad \mathrm{mm}^{2}=$ square millimeter
$\mathrm{mm}^{3}=$ cubic millimetre
$\mathrm{cm}=$ centimetre
$\mathrm{cm}^{3}=$ cubic centimetre
$\mathrm{dm}=$ decimetre $\quad \mathrm{dm}^{2}=$ square decimetre
$\mathrm{dm}^{3}=$ cubic decimetre
$\mathrm{m}=$ metre
$\mathrm{m}=$ cubic metre
$\mathrm{Dm}=$ decametre $\quad \mathrm{Dm}^{2}=$ square decametre
$\mathrm{Dm}^{3}=$ cubic decametre
$\mathrm{Hm}=$ hectometre $\quad \mathrm{Hm}^{2}=$ square hectometre
$\mathrm{Hm}^{3}=$ cubic hectometre
$\mathrm{Km}=$ kilometre $\quad \mathrm{Km}^{2}=$ square kilometre
$\mathrm{Km}^{3}=$ cubic kilometre
Figure 2: The Transformation of Figure-1 into Complete One, Two and Three Dimensions Distance-Conversion Model
Figure 2a

Figure 2b

Figure 2c

The distance-conversion model has three dimensions (i.e. One Dimension Distance, Two Dimension Distance (Area) and Three Dimension Distance (Volume)). Each dimension of distance has six steps / movements.

## One Dimension Distance (The Length (L)-Conversion Model)

This only looks at a one space with no common meeting point between two objects i.e. mm to $\mathrm{cm}, \mathrm{cm}$ to $\mathrm{dm}, \mathrm{dm}$ to $\mathrm{m}, \mathrm{m}$ to $\mathrm{Dm}, \mathrm{Dm}$ to Hm and Hm to Km . from figure 1, the straight line has been divided into 10 equal distances starting from mm to Km . This meant that 10 steps of mm will give 1 step of cm and it follows through to Km.
NB: when dealing with conversion, then one must be in the realms of multiplication (i.e. movement from the least unit to the maximum unit) and division (i.e. movement from the maximum unit to the least unit). With this straight line on distance, the least unit is the millimetre ( mm ) and the maximum unit is the kilometre (Km)

Figure 3

Figure 4: Complete labelled One Dimension DistanceConversion Model

Figure 5: One Step/ Movement

In figure 5, one step was made starting from mm to the right i.e. the step from mm to cm . since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from mm to cm is 10 and the second movement from cm to dm is also 10 , thus $10=10^{1}=10$ (i.e. 10 mm $=1 \mathrm{~cm}$ )
Step One / Movement One
$10\left(1 \times 10^{1}\right) \mathrm{mm}=1 \mathrm{~cm}$
$10\left(1 \times 10^{1}\right) \mathrm{cm}=1 \mathrm{dm}$
$10\left(1 \times 10^{1}\right) \mathrm{dm}=1 \mathrm{~m}$
$10\left(1 \times 10^{1}\right) \mathrm{m}=1 \mathrm{Dm}$
$10\left(1 \times 10^{1}\right) \mathrm{Dm}=1 \mathrm{Hm}$
$10\left(1 \times 10^{1}\right) \mathrm{Hm}=1 \mathrm{Km}$
Figure 6: Two Steps/ Movements

In figure 6, two steps were made starting from mm to the right i.e. the first step from mm to cm and from cm to dm . since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from mm to cm is 10 and the second movement from cm to dm is also 10 , thus $10 \times 10=10^{2}=100$ (i.e. $100 \mathrm{~mm}=1 \mathrm{dm}$ ).
Step Two/ Movement Two
$100\left(1 \times 10^{2}\right) \mathrm{mm}=1 \mathrm{dm}$
$100\left(1 \times 10^{2}\right) \mathrm{cm}=1 \mathrm{~m}$
$100\left(1 \times 10^{2}\right) \mathrm{dm}=1 \mathrm{Dm}$
$100\left(1 \times 10^{2}\right) \mathrm{m}=1 \mathrm{Hm}$
$100\left(1 \times 10^{2}\right) \mathrm{Dm}=1 \mathrm{Km}$

Figure 7: Three Steps/ Movements

In figure 7, three steps were made starting from mm to the right i.e. the first step from mm to $\mathrm{cm}, \mathrm{cm}$ to dm and from dm to m . since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from mm to cm is 10 , the second movement from cm to dm is 10 and the last step from dm to m is also 10 , thus $10 \times 10 \times 10=10^{3}=1000$ (i.e. $1000 \mathrm{~mm}=1 \mathrm{~m}$ ).

Step Three/ Movement Three
$1000\left(1 \times 10^{3}\right) \mathrm{mm}=1 \mathrm{~m}$
$1000\left(1 \times 10^{3}\right) \mathrm{cm}=1 \mathrm{Dm}$
$1000\left(1 \times 10^{3}\right) \mathrm{dm}=1 \mathrm{Hm}$
$1000\left(1 \times 10^{3}\right) \mathrm{m}=1 \mathrm{Km}$
Figure 8: Four Steps/ Movements

In figure 8, four steps were made starting from mm to the right i.e. the first step from mm to $\mathrm{cm}, \mathrm{cm}$ to $\mathrm{dm}, \mathrm{dm}$ to m and from $m$ to $D m$. since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from mm to cm is 10 , the second movement from cm to dm is 10 , the third movement from dm to m is 10 and the last step from m to Dm is also 10 , thus $10 \times 10 \times 10 \times 10=10^{4}=10000$ (i.e. $10000 \mathrm{~mm}=1 \mathrm{Dm}$ ).

Step Four/ Movement Four
$10000\left(1 \times 10^{4}\right) \mathrm{mm}=1 \mathrm{Dm}$
$10000\left(1 \times 10^{4}\right) \mathrm{cm}=1 \mathrm{Hm}$
$10000\left(1 \times 10^{4}\right) \mathrm{dm}=1 \mathrm{Km}$
Figure 9: Five Steps/ Movements

In figure 9, five steps were made starting from mm upward i.e. the first step from mm to $\mathrm{cm}, \mathrm{cm}$ to $\mathrm{dm}, \mathrm{dm}$ to $\mathrm{m}, \mathrm{m}$ to Dm and from Dm to Hm . since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from mm to cm is 10 , the second movement from cm to dm is 10 , the third movement from dm to m is 10 , the fourth movement from m to Dm is 10 and the last step from Dm to Hm is also 10 , thus $10 \times 10 \times 10 \times 10 \times 10=10^{5}=100000$ (i.e. $100000 \mathrm{~mm}=1 \mathrm{Hm}$ ).
Step Five/ Movement Five
$100000\left(1 \times 10^{5}\right) \mathrm{mm}=1 \mathrm{Hm}$
$100000\left(1 \times 10^{5}\right) \mathrm{cm}=1 \mathrm{Km}$
Figure 10: Six Steps/ Movements

In figure 10, six steps were made starting from mm to the right i.e. the first step from mm to $\mathrm{cm}, \mathrm{cm}$ to $\mathrm{dm}, \mathrm{dm}$ to $\mathrm{m}, \mathrm{m}$ to Dm , Dm to Hm and from Hm to Km . since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from mm to cm is 10 , the second movement from cm to dm is 10 , the third movement from dm to m is 10 , the fourth movement from m to Dm is 10 , the fifth movement from Dm to Hm is 10 and the last step from Hm to Km is also 10 , thus $10 \times 10 \times 10 \times 10 \times 10 \times 10=10^{6}=1000000$ (i.e. $1000000 \mathrm{~mm}=1 \mathrm{Km}$ ).
Step Six/ Movement Six
$1000000\left(1 \times 10^{6}\right) \mathrm{mm}=1 \mathrm{Km}$

Two Dimension Distance (Area-Conversion Model)
A straight line is divided into seven equal parts. The distance between each part is hundred (100).

Figure 11

The number line is labelled $\mathrm{mm}^{2}, \mathrm{~cm}^{2}, \mathrm{dm}^{2}, \mathrm{~m}^{2}, \mathrm{Dm}^{2}, \mathrm{Hm}^{2}$ and $\mathrm{Km}^{2}$.
$\mathrm{mm}^{2}=$ millimetre square
$\mathrm{cm}^{2}=$ centimetre square
$\mathrm{dm}^{2}=$ decimetre square
$\mathrm{m}^{2}=$ metre square
$\mathrm{Dm}^{2}=$ decametre square
$\mathrm{Hm}^{2}=$ hectometre square
$\mathrm{Km}^{2}=$ kilometre square
Figure 12: The Complete Labelled Two Dimension DistanceConversion Model
(Area-Conversion Model)

The two dimension of distance looks at two spaces

) with a common meeting point between two objects (Asiedu \& Baah-Yeboah, 2004; Brown, 1999; Serway \& Jewett, 2004; Awe \& Okunola, 1992; http://www.bayhicoach.com) i.e. $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}, \mathrm{~cm}^{2}$ to $\mathrm{dm}^{2}, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}, \mathrm{~m}^{2}$ to $\mathrm{Dm}^{2}, \mathrm{Dm}^{2}$ to $\mathrm{Hm}^{2}$ and $\mathrm{Hm}^{2}$ to $\mathrm{Km}^{2}$. from figure 13, a straight line has been divided into 100 equal distances starting from $\mathrm{mm}^{2}$ to $\mathrm{Km}^{2}$. This meant that 100 steps of $\mathrm{mm}^{2}$ will give 1 step of $\mathrm{cm}^{2}$ and it follows through to $\mathrm{Km}^{2}$.

Figure 13: One Step/ Movement

In figure 13, one step was made starting from $\mathrm{mm}^{2}$ to the right i.e. the step from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$. since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ is 100 and the second movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is also 100 , thus $100=10^{2}=100$ (i.e. $100 \mathrm{~mm}^{2}=1 \mathrm{~cm}^{2}$ ).
The Mathematical proof:
Area $=$ length $*$ length $=L^{2}$
$1 \mathrm{~cm}^{2}=1 \mathrm{~cm} \times 1 \mathrm{~cm}$
But $10 \mathrm{~mm}=1 \mathrm{~cm}$
$\Longrightarrow 1 \mathrm{~cm}^{2}=1 \mathrm{~cm} \times 1 \mathrm{~cm}=10 \mathrm{~mm} \times 10 \mathrm{~mm}=10 \times 10(\mathrm{~mm} \times \mathrm{mm})$ $=10^{2} \mathrm{~mm}^{2}=100 \mathrm{~mm}^{2}$
Step One / Movement One
$100\left(1 \times 10^{2}\right) \mathrm{mm}^{2}=1 \mathrm{~cm}^{2}$
$100\left(1 \times 10^{2}\right) \mathrm{cm}^{2}=1 \mathrm{dm}^{2}$
$100\left(1 \times 10^{2}\right) \mathrm{dm}^{2}=1 \mathrm{~m}^{2}$
$100\left(1 \times 10^{2}\right) \mathrm{m}^{2}=1 \mathrm{Dm}^{2}$
$100\left(1 \times 10^{1}\right) \mathrm{Dm}^{2}=1 \mathrm{Hm}^{2}$
$100\left(1 \times 10^{2}\right) \mathrm{Hm}^{2}=1 \mathrm{Km}^{2}$

Figure 14: Two Step/ Movement

In figure 14 , two steps were made starting from $\mathrm{mm}^{2}$ to the right i.e. the first step from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ and from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$. It then implies that the first movement from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ is 100 and the second movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is also 100 , thus $100 \times 100=10^{4}=10000$ (i.e. $10000 \mathrm{~mm}^{2}=1 \mathrm{dm}^{2}$ )
Step Two/ Movement Two
$10000\left(1 \times 10^{4}\right) \mathrm{mm}^{2}=1 \mathrm{dm}^{2}$
$10000\left(1 \times 10^{4}\right) \mathrm{cm}^{2}=1 \mathrm{~m}^{2}$
$10000\left(1 \times 10^{4}\right) \mathrm{dm}^{2}=1 \mathrm{Dm}^{2}$
$10000\left(1 \times 10^{4}\right) \mathrm{m}^{2}=1 \mathrm{Hm}^{2}$
$10000\left(1 \times 10^{4}\right) \mathrm{Dm}^{2}=1 \mathrm{Km}^{2}$
Figure 15: Three Steps/ Movements

In figure 15, three steps were made starting from $\mathrm{mm}^{2}$ to the right i.e. the first step from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}, \mathrm{~cm}^{2}$ to $\mathrm{dm}^{2}$ and from $\mathrm{dm}^{2}$ to $\mathrm{m}^{2}$, it then implies that the first movement from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ is 100 , the second movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is 100 and the last step from $\mathrm{dm}^{2}$ to $\mathrm{m}^{2}$ is also 100 , thus $100 \times 100 \times 100=10^{6}=1000000$ (i.e. $1000000 \mathrm{~mm}^{2}=1 \mathrm{~m}^{2}$ ).
Step Three/ Movement Three
$1000000\left(1 \times 10^{6}\right) \mathrm{mm}^{2}=1 \mathrm{~m}^{2}$
$1000000\left(1 \times 10^{6}\right) \mathrm{cm}^{2}=1 \mathrm{Dm}^{2}$
$1000000\left(1 \times 10^{6}\right) \mathrm{dm}^{2}=1 \mathrm{Hm}^{2}$
$1000000\left(1 \times 10^{6}\right) \mathrm{m}^{2}=1 \mathrm{Km}^{2}$
Figure 16: Four Steps/ Movements

In figure 16, four steps were made starting from $\mathrm{mm}^{2}$ to the right i.e. the first step from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}, \mathrm{~cm}^{2}$ to $\mathrm{dm}^{2}, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}$ and from $\mathrm{m}^{2}$ to $\mathrm{Dm}^{2}$, it then implies that the first movement from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ is 100 , the second movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is $100, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}$ is 100 and the last step from $\mathrm{m}^{2}$ to $\mathrm{Dm}^{2}$ is also 100, thus $100 \times 100 \times 100 \times 100=10^{8}=100000000 \quad$ (i.e. $100000000 \mathrm{~mm}^{2}=1 \mathrm{Dm}^{2}$ ).
Step Four/ Movement Four
$100000000\left(1 \times 10^{8}\right) \mathrm{mm}^{2}=1 \mathrm{Dm}^{2}$
$100000000\left(1 \times 10^{8}\right) \mathrm{cm}^{2}=1 \mathrm{Hm}^{2}$
$100000000\left(1 \times 10^{8}\right) \mathrm{dm}^{2}=1 \mathrm{Km}^{2}$

Figure 17: Five Steps/ Movements

In figure 17, five steps were made starting from $\mathrm{mm}^{2}$ to the right i.e. the first step from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}, \mathrm{~cm}^{2}$ to $\mathrm{dm}^{2}, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}$, $\mathrm{m}^{2}$ to $\mathrm{Dm}^{2}$ and from $\mathrm{Dm}^{2}$ to $\mathrm{Hm}^{2}$, it then implies that the first movement from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ is 100 , the second movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is $100, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}$ is $100, \mathrm{~m}^{2}$ to $\mathrm{Dm}^{2}$ and the last step from $\mathrm{Dm}^{2}$ to $\mathrm{Hm}^{2}$ is also 100, thus $100 \times 100 \times 100 \times 100 \times 100=10^{10}=10000000000$ (i.e. $10000000000 \mathrm{~mm}^{2}=1 \mathrm{Hm}^{2}$ ).
Step Five/ Movement Five
$10000000000\left(1 \times 10^{10}\right) \mathrm{mm}^{2}=1 \mathrm{Hm}^{2}$
$10000000000\left(1 \times 10^{10}\right) \mathrm{cm}^{2}=1 \mathrm{Km}^{2}$
Figure 18: Six Steps/ Movements

In figure 18 , six steps were made starting from $\mathrm{mm}^{2}$ to the right i.e. the first step from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}, \mathrm{~cm}^{2}$ to $\mathrm{dm}^{2}, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}$, $\mathrm{m}^{2}$ to $\mathrm{Dm}^{2}, \mathrm{Dm}^{2}$ to $\mathrm{Hm}^{2}$ and from $\mathrm{Hm}^{2}$ to $\mathrm{Km}^{2}$, it then implies that the first movement from $\mathrm{mm}^{2}$ to $\mathrm{cm}^{2}$ is 100 , the second movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is $100, \mathrm{dm}^{2}$ to $\mathrm{m}^{2}$ is $100, \mathrm{~m}^{2}$ to $\mathrm{Dm}^{2}$, $\mathrm{Dm}^{2}$ to $\mathrm{Hm}^{2}$ and the last step from $\mathrm{Hm}^{2}$ to $\mathrm{Km}^{2}$ is also 100, thus $100 \times 100 \times 100 \times 100 \times 100 \times 100=10^{12}=1000000000000$ (i.e. $10000000000 \mathrm{~mm}^{2}=1 \mathrm{Km}^{2}$ ).
Step Six/ Movement Six
$1000000000000\left(1 \times 10^{12}\right) \mathrm{mm}^{2}=1 \mathrm{Km}^{2}$
Table 2: Two Dimension Distance Summary

## Three Dimension Distance (Volume-Conversion Model)

A straight line is divided into seven equal parts. The distance between each part is one thounsand (1000).
Figure 19

The number line is labelled $\mathrm{mm}^{3}, \mathrm{~cm}^{3}, \mathrm{dm}^{3}, \mathrm{~m}^{3}, \mathrm{Dm}^{3}, \mathrm{Hm}^{3}$ and $\mathrm{Km}^{3}$.
$\mathrm{mm}^{3}=$ millimetre cube
$\mathrm{cm}^{3}=$ centimetre cube
$\mathrm{dm}^{3}=$ decimetre cube $=1$ Litre
$\mathrm{m}^{3}=$ metre cube
$\mathrm{Dm}^{3}=$ decametres cube
$\mathrm{Hm}^{3}=$ hectometre cube
$\mathrm{Km}^{3}=$ kilometre cube
Figure 20: The Complete Labelled Three Dimension Distance-Conversion Model (Volume-Conversion Model)

The three dimension of distance looks at three spaces ( 1 ) with a common meeting point between two objects (Asiedu \& Baah-Yeboah, 2004; Brown, 1999; Serway \& Jewett, 2004; Awe \& Okunola, 1992; http://www.bayhicoach.com) i.e. $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}, \mathrm{~cm}^{3}$ to $\mathrm{dm}^{3}, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}, \mathrm{~m}^{3}$ to $\mathrm{Dm}^{3}, \mathrm{Dm}^{3}$ to $\mathrm{Hm}^{3}$ and $\mathrm{Hm}^{3}$ to $\mathrm{Km}^{3}$. from figure 20, a straight line has been divided into 1000 equal distances starting from $\mathrm{mm}^{3}$ to $\mathrm{Km}^{3}$. This meant that 1000 steps of $\mathrm{mm}^{3}$ will give 1 step of $\mathrm{cm}^{3}$ and it follows through to $\mathrm{Km}^{3}$.

Figure 21: One Step/ Movement

In figure 21, one step was made starting from $\mathrm{mm}^{3}$ to the right i.e. the step from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ is 1000 , and the movement from $\mathrm{cm}^{2}$ to $\mathrm{dm}^{2}$ is also 1000 , thus $1000\left(10^{3}\right) \mathrm{mm}^{3}=1 \mathrm{~cm}^{3}$ The Mathematical proof:
Volume $=$ length $\times$ length $\times$ Length $=L^{3}$
$1 \mathrm{~cm}^{3}=1 \mathrm{~cm} \times 1 \mathrm{~cm} \times 1 \mathrm{~cm}$
But $10 \mathrm{~mm}=1 \mathrm{~cm}$
$\Rightarrow 1 \mathrm{~cm}^{3}=1 \mathrm{~cm} \times 1 \mathrm{~cm} \times 1 \mathrm{~cm} \equiv 10 \mathrm{~mm} \times 10 \mathrm{~mm} \times 10 \mathrm{~mm}$
Step One/ Movement One
$1000\left(1 \times 10^{3}\right) \mathrm{mm}^{3}=1 \mathrm{~cm}^{3}$
$1000\left(1 \times 10^{3}\right) \mathrm{cm}^{3}=1 \mathrm{dm}^{3}$
$1000\left(1 \times 10^{3}\right) \mathrm{dm}^{3}=1 \mathrm{~m}^{3}$
$1000\left(1 \times 10^{3}\right) \mathrm{m}^{3}=1 \mathrm{Dm}^{3}$
$1000\left(1 \times 10^{3}\right) \mathrm{Dm}^{3}=1 \mathrm{Hm}^{3}$
$1000\left(1 \times 10^{3}\right) \mathrm{Hm}^{3}=1 \mathrm{Km}^{3}$

Figure 22: Two Step/ Movement

In figure 22 , two steps were made starting from $\mathrm{mm}^{3}$ to the right i.e. the first step from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ and from $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$. It then implies that the first movement from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ is 1000 and the second movement from $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$ is also 1000 , thus $1000 \times 1000=10^{6}=1000000$ (i.e. $1000000 \mathrm{~mm}^{3}=1 \mathrm{dm}^{3}$ )
Step Two/ Movement Two
$1000000\left(1 \times 10^{6}\right) \mathrm{mm}^{3}=1 \mathrm{dm}^{3}$
$1000000\left(1 \times 10^{6}\right) \mathrm{cm}^{3}=1 \mathrm{~m}^{3}$
$1000000\left(1 \times 10^{6}\right) \mathrm{dm}^{3}=1 \mathrm{Dm}^{3}$
$1000000\left(1 \times 10^{6}\right) \mathrm{m}^{3}=1 \mathrm{Hm}^{3}$
$1000000\left(1 \times 10^{6}\right) \mathrm{Dm}^{3}=1 \mathrm{Km}^{3}$
Figure 23: Three Steps/ Movements

In figure 23, three steps were made starting from $\mathrm{mm}^{3}$ to the right i.e. the first step from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}, \mathrm{~cm}^{3}$ to $\mathrm{dm}^{3}$ and from $\mathrm{dm}^{3}$ to $\mathrm{m}^{3}$, it then implies that the first movement from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ is 1000 , the second movement from $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$ is 1000 and the last step from $\mathrm{dm}^{3}$ to $\mathrm{m}^{3}$ is also 1000 , thus $1000 \times 1000 \times 1000=10^{9}=1000000000$ (i.e. $1000000000 \mathrm{~mm}^{3}=$ $1 \mathrm{~m}^{3}$ ).
Step Three/ Movement Three
$1000000000\left(1 \times 10^{9}\right) \mathrm{mm}^{3}=1 \mathrm{~m}^{3}$
$1000000000\left(1 \times 10^{9}\right) \mathrm{cm}^{3}=1 \mathrm{Dm}^{3}$
$1000000000\left(1 \times 10^{9}\right) \mathrm{dm}^{3}=1 \mathrm{Hm}^{3}$
$1000000000\left(1 \times 10^{9}\right) \mathrm{m}^{3}=1 \mathrm{Km}^{3}$
Figure 24: Four Steps/ Movements

In figure 24, four steps were made starting from $\mathrm{mm}^{3}$ to the right i.e. the first step from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}, \mathrm{~cm}^{3}$ to $\mathrm{dm}^{3}, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}$ and from $\mathrm{m}^{3}$ to $\mathrm{Dm}^{3}$, it then implies that the first movement from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ is 1000 , the second movement from $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$ is $1000, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}$ is 1000 and the last step from $\mathrm{m}^{3}$ to $\mathrm{Dm}^{3}$ is 1000 , thus $1000 \times 1000 \times 1000 \times 1000=10^{12}=1000000000000$ (i.e. $1000000000000 \mathrm{~mm}^{3}=1 \mathrm{Dm}^{3}$ ).

Step Four/ Movement Four
$1000000000000\left(1 \times 10^{12}\right) \mathrm{mm}^{3}=1 \mathrm{Dm}^{3}$
$1000000000000\left(1 \times 10^{12}\right) \mathrm{cm}^{3}=1 \mathrm{Hm}^{3}$
$1000000000000\left(1 \times 10^{12}\right) \mathrm{dm}^{3}=1 \mathrm{Km}^{3}$
Figure 25: Five Steps/ Movements

In figure 25 , five steps were made starting from $\mathrm{mm}^{3}$ to the right i.e. the first step from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}, \mathrm{~cm}^{3}$ to $\mathrm{dm}^{3}, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}, \mathrm{~m}^{3}$ to $\mathrm{Dm}^{3}$ and from $\mathrm{Dm}^{3}$ to $\mathrm{Hm}^{3}$, it then implies that the first movement from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ is 1000 , the second movement from $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$ is $1000, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}$ is $1000, \mathrm{~m}^{3}$ to $\mathrm{Dm}^{3}$ is 1000 and the last step from $\mathrm{Dm}^{3}$ to $\mathrm{Hm}^{3}$ is also 1000, thus $1000 \times 1000 \times 1000 \times 1000 \times 1000=10^{15}=1000000000000000 \quad$ (i.e. $1000000000000000 \mathrm{~mm}^{2}=1 \mathrm{Hm}^{2}$ ).
Step Five/ Movement Five
$1000000000000000\left(1 \times 10^{15}\right) \mathrm{mm}^{3}=1 \mathrm{Hm}^{3}$
$1000000000000000\left(1 \times 10^{15}\right) \mathrm{cm}^{3}=1 \mathrm{Km}^{3}$
Figure 26: Six Steps/ Movements

In figure 26 , six steps were made starting from $\mathrm{mm}^{3}$ to the right. The i.e. the steps are $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}, \mathrm{~cm}^{3}$ to $\mathrm{dm}^{3}, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}, \mathrm{~m}^{3}$ to $\mathrm{Dm}^{3}, \mathrm{Dm}^{3}$ to $\mathrm{Hm}^{3}$ and from $\mathrm{Hm}^{3}$ to $\mathrm{Km}^{3}$, it then implies that the first movement from $\mathrm{mm}^{3}$ to $\mathrm{cm}^{3}$ is 1000 , the second movement from $\mathrm{cm}^{3}$ to $\mathrm{dm}^{3}$ is $1000, \mathrm{dm}^{3}$ to $\mathrm{m}^{3}$ is $1000, \mathrm{~m}^{3}$ to $\mathrm{Dm}^{3}$ is 1000 , $\mathrm{Dm}^{3}$ to $\mathrm{Hm}^{3}$ is 1000 and the last step from $\mathrm{Hm}^{3}$ to $\mathrm{Km}^{3}$ is also 1000,
thus
$1000 \times 1000 \times 1000 \times 1000 \times 1000 \times 1000=10^{18}=1000000000000000$ 000 (i.e. $10000000000000000 \mathrm{~mm}^{3}=1 \mathrm{Km}^{3}$ ).
Step Six/ Movement Six
$1000000000000\left(1 \times 10^{18}\right) \mathrm{mm}^{3}=1 \mathrm{Km}^{3}$

The Time-Conversion Model
A number line is divided into two equal parts. The distance between each part is sixty (60).
Figure 2

The number line is labelled s, min, Hr .
$\mathrm{s}=$ second
$\min =$ minute
$\mathrm{Hr}=$ hour
Figure 2: The Complete Labelled Time-Conversion Model

The time-conversion model has two steps (i.e. Step One, and Step Two).

Figure 3: One Step/ Movement

In figure 3, one step was made starting from $s$ to the right i.e. the step from s to min, it then implies that the first movement from s to min is 60 and the second movement from min to Hr is also 60 , thus $60=6 \times 10^{1}=6 \times 10$ (i.e. $60 \mathrm{~s}=1 \mathrm{~min}$ )
Step One / Movement One
$60\left(6 \times 10^{1}\right) \mathrm{s}=1 \mathrm{~min}$
$60\left(6 \times 10^{1}\right) \mathrm{min}=1 \mathrm{Hr}$
Figure 4: Two Steps/ Movements

In figure 4, two steps were made starting from $s$ to the right i.e. the first step from s to min and from min to Hr. since moving from the least unit to the maximum unit deals with multiplication, it then implies that the first movement from sto min is 60 and the second movement from min to Hr is also 60 , thus $60 \times 60=6^{2} \times 10^{2}=36 \times 100$ (i.e. $3600 \mathrm{~s}=1 \mathrm{Hr}$ )
Step Two/ Movement Two
$3600\left(6^{2} \times 10^{2}\right) \mathrm{s}=1 \mathrm{Hr}$
Table 4: Time-Conversion Model Summary

| Step 1 | Step 2 |
| :--- | :--- |
| $60\left(6 \times 10^{1}\right) \mathrm{s}=1 \mathrm{~min}$ | $3600\left(6^{2} \times 10^{2}\right) \mathrm{s}=1 \mathrm{Hr}$ |
| $60\left(6 \times 10^{1}\right) \mathrm{min}=1 \mathrm{Hr}$ |  |

## The Mass-Conversion Model

A straight line is divided into six equal parts. The distance between each part is ten (10).

Figure 3

The number line is labelled $\mathrm{mg}, \mathrm{cg}, \mathrm{dg}, \mathrm{g}, \mathrm{Dg}, \mathrm{Hg}$ and kg .
$\mathrm{mg}=$ milligram
$\mathrm{cg}=$ centigram
dg $=$ decigram
$\mathrm{g}=\mathrm{gram}$
Dg = dekagram
$\mathrm{Hg}=$ hectogram
$\mathrm{Kg}=$ kilogram

Figure 2: The Complete Labelled Mass-Conversion Model

Figure 3: One Step/ Movement

In figure 3, one step was made starting from mg to the right i.e. the step from mg to cg , cg to dg , dg to $\mathrm{g}, \mathrm{g}$ to $\mathrm{Dg}, \mathrm{Dg}$ to Hg , and Hg to Kg . This then implies that the movement from mg to cg is 10 thus $10=1 \times 10^{1}$ (i.e. $10 \mathrm{mg}=1 \mathrm{cg}$ )
Step One / Movement One
$10 \mathrm{mg}=1 \mathrm{cg}$
$10 \mathrm{cg}=1 \mathrm{dg}$
$10 \mathrm{dg}=1 \mathrm{~g}$
$10 \mathrm{~g}=1 \mathrm{Dg}$
$10 \mathrm{Dg}=1 \mathrm{Hg}$
$10 \mathrm{Hg}=1 \mathrm{Kg}$
Figure 5: Two Step/ Movement

In figure 5, two steps were made starting from mg to the right i.e. the step from mg to dg , cg to g , dg to $\mathrm{Dg}, \mathrm{g}$ to Hg , and Dg to Kg . This then implies that the movement from mg to dg is 100 thus $10 \times 10=1 \times 10^{2}$ (i.e. $100 \mathrm{mg}=1 \mathrm{dg}$ )
Step Two / Movement Two
$100 \mathrm{mg}=1 \mathrm{dg}$
$100 \mathrm{cg}=1 \mathrm{~g}$
$100 \mathrm{dg}=1 \mathrm{Dg}$
$100 \mathrm{~g}=1 \mathrm{Hg}$
$100 \mathrm{Dg}=1 \mathrm{Kg}$
Figure 6: Three Step/ Movement

In figure 6, three steps were made starting from mg to the right i.e. the step from mg to $\mathrm{g}, \mathrm{cg}$ to Dg , dg to Hg , and g to Kg . This then implies that the movement from mg to g is 1000 thus $10 \times 10 \times 10=1 \times 10^{3}$ (i.e. $1000 \mathrm{mg}=1 \mathrm{~g}$ )
Step Three / Movement Three
$1000 \mathrm{mg}=1 \mathrm{~g}$
$1000 \mathrm{cg}=1 \mathrm{Dg}$
$1000 \mathrm{dg}=1 \mathrm{Hg}$
$1000 \mathrm{~g}=1 \mathrm{Kg}$
Figure 7: Four Step/ Movement

In figure 7, four steps were made starting from mg to the right i.e. the step from mg to Dg , cg to Hg , and dg to Kg . This then implies that the movement from mg to Dg is 10000 thus $10 \times 10 \times 10 \times 10=1 \times 10^{4}$ (i.e. $10000 \mathrm{mg}=1 \mathrm{Dg}$ )
Step Four / Movement Four
$10000 \mathrm{mg}=1 \mathrm{Dg}$
$10000 \mathrm{cg}=1 \mathrm{Hg}$
$10000 \mathrm{dg}=1 \mathrm{Kg}$
Figure 8: Five Step/ Movement

In figure 8, five steps were made starting from mg to the right i.e. the step from mg to Hg , and cg to Kg . This then implies that the movement from mg to Hg is 100000 thus $10 \times 10 \times 10 \times 10 \times 10=1 \times 10^{5}$ (i.e. $100000 \mathrm{mg}=1 \mathrm{Hg}$ )
Step Five / Movement Four
$100000 \mathrm{mg}=1 \mathrm{Hg}$
$100000 \mathrm{cg}=1 \mathrm{Kg}$
Figure 9: Six Step/ Movement

In figure 9, six steps were made starting from mg to the right i.e. the step from mg to Kg . This then implies that the
movement from mg to Kg is 1000000 thus $10 \times 10 \times 10 \times 10 \times 10 \times 10=1 \times 10^{6}$ (i.e. $1000000 \mathrm{mg}=1 \mathrm{Kg}$ )
Step Six / Movement Four
$1000000 \mathrm{mg}=1 \mathrm{Kg}$
Table 5: Mass-Conversion Model Summary

| $\begin{aligned} & 10 \mathrm{~g}= \\ & 1 \mathrm{Dg} \end{aligned}$ | $\begin{aligned} & 100 \mathrm{~g}= \\ & 1 \mathrm{Hg} \end{aligned}$ | $\begin{aligned} & 1000 \mathrm{~g}= \\ & 1 \mathrm{Kg} \end{aligned}$ |  |  |  |
| $\begin{aligned} & 10 \mathrm{Dg}= \\ & 1 \mathrm{Hg} \end{aligned}$ | $\begin{aligned} & 100 \mathrm{Dg}=1 \\ & \mathrm{Kg} \end{aligned}$ |  |  |  |  |
| $\begin{aligned} & 10 \mathrm{Hg} \\ & =1 \mathrm{Kg} \end{aligned}$ |  |  |  |  |  |

## The Litre-Conversion Model

A straight line is divided into six equal parts. The distance between each part is ten (10).
Figure 4

The number line is labelled $\mathrm{mL}, \mathrm{cL}, \mathrm{dL}, \mathrm{L}, \mathrm{DL}, \mathrm{HL}$ and KL.
$\mathrm{mL}=$ millilitre
$\mathrm{cL}=$ centilitre
$\mathrm{dL}=$ decilitre
$\mathrm{L}=$ litre
DL = dekalitre
HL $=$ hectolitre
$\mathrm{KL}=$ kilolitre
Figure 2: The Complete Labelled Litre-Conversion Model

Figure 3: One Step/ Movement

In figure 3, one step was made starting from mL to the right i.e. the step from $m L$ to $c L, ~ c L$ to $d L, ~ d L$ to $L, L$ to $D L, ~ D L$ to HL, and HL to KL. This then implies that the movement from mL to cL is 10 thus $10=1 \times 10^{1}$ (i.e. $10 \mathrm{~mL}=1 \mathrm{cL}$ )
Step One / Movement One
$10 \mathrm{~mL}=1 \mathrm{cL}$
$10 \mathrm{cL}=1 \mathrm{dL}$
$10 \mathrm{dL}=1 \mathrm{~L}$
$10 \mathrm{~L}=1 \mathrm{DL}$
$10 \mathrm{DL}=1 \mathrm{HL}$
$10 \mathrm{HL}=1 \mathrm{KL}$
Figure 5: Two Step/ Movement

In figure 5, two steps were made starting from mL to the right i.e. the step from mL to dL , cL to L , dL to $\mathrm{DL}, \mathrm{L}$ to HL , and DL to KL. This then implies that the movement from mL to dL is 100 thus $10 \times 10=1 \times 10^{2}$ (i.e. $100 \mathrm{~mL}=1 \mathrm{dL}$ )
Step Two / Movement Two
$100 \mathrm{~mL}=1 \mathrm{dL}$
$100 \mathrm{cL}=1 \mathrm{~L}$
$100 \mathrm{dL}=1 \mathrm{~L}$
$100 \mathrm{~L}=1 \mathrm{HL}$
$100 \mathrm{DL}=1 \mathrm{KL}$
Figure 6: Three Step/ Movement

In figure 6 , three steps were made starting from mL to the right i.e. the step from mL to $\mathrm{L}, \mathrm{cL}$ to $\mathrm{DL}, \mathrm{dL}$ to HL , and L to KL. This then implies that the movement from mL to L is 1000 thus $10 \times 10 \times 10=1 \times 10^{3}$ (i.e. $1000 \mathrm{~mL}=1 \mathrm{~L}$ )
Step Three / Movement Three
$1000 \mathrm{~mL}=1 \mathrm{~L}$
$1000 \mathrm{cL}=1 \mathrm{DL}$
$1000 \mathrm{dL}=1 \mathrm{HL}$
$1000 \mathrm{~L}=1 \mathrm{KgL}$
Figure 7: Four Step/ Movement

In figure 7, four steps were made starting from mL to the right i.e. the step from mL to $\mathrm{DL}, \mathrm{cL}$ to HL , and dL to KL. This then implies that the movement from mL to DL is 10000 thus $10 \times 10 \times 10 \times 10=1 \times 10^{4}$ (i.e. $10000 \mathrm{~mL}=1 \mathrm{DL}$ )
Step Four / Movement Four
$10000 \mathrm{~mL}=1 \mathrm{DL}$

$$
\begin{aligned}
& 10000 \mathrm{cL}=1 \mathrm{HL} \\
& 10000 \mathrm{dL}=1 \mathrm{KL}
\end{aligned}
$$

Figure 8: Five Step/ Movement

In figure 8, five steps were made starting from mL to the right i.e. the step from mL to HL , and cL to KL. This then implies that the movement from mL to HL is 100000 thus $10 \times 10 \times 10 \times 10 \times 10=1 \times 10^{5}$ (i.e. $100000 \mathrm{~mL}=1 \mathrm{HL}$ )
Step Five / Movement Four
$100000 \mathrm{~mL}=1 \mathrm{HL}$
$100000 \mathrm{cL}=1 \mathrm{KL}$
Figure 9: Six Step/ Movement

In figure 9, six steps were made starting from mL to the right i.e. the step from mL to KL. This then implies that the movement from mL to KL is 1000000 thus $10 \times 10 \times 10 \times 10 \times 10 \times 10=1 \times 10^{6}$ (i.e. $1000000 \mathrm{~mL}=1 \mathrm{KL}$ )
Step Six / Movement Four
$1000000 \mathrm{~mL}=1 \mathrm{KL}$
Table 6: Litre-Conversion Model Summary

| Step 1 | Step 2 | Step 3 | Step 4 | Step 5 | Step 6 |

Mathematical proof of the number of steps/movements on the DTML-conversion model
Movement In One Dimension
The one dimension of units in the DTML-Conversion model are Length, Mass, Litre, and Time.

Figure 1: the Length (L)-Conversion Model

Figure 3: the Litre-Conversion Model

Figure 4: the Time (T)-Conversion Model

Figure 1, 2 and 3 will be considered now and after the proving, will be applied to figure 4

Figure 5: the proved Diagram for One DimensionConversion Model

$\mathrm{A}=\mathrm{mm}=\mathrm{mg}=\mathrm{mL}$ (figure 1, 2 and 3)
Let $y=$ equal distance/space between alphabets (figure 5)
$\mathrm{n}=$ the number of steps / movements from the starting point, A

$$
\mathrm{h}=\text { the index of the spaces between the alphabets i.e. } \mathrm{y}^{\mathrm{h}}
$$

From figure 5, n depends on y.
Mathematically,
$\mathrm{n} \propto \mathrm{y}$
Hence, $n=k y, k=$ constant of proportionality
Let y be raised to an index h
$\mathrm{n}_{\mathrm{h}}=\mathrm{ky}^{\mathrm{h}}, \mathrm{k} \neq 0$, if $\mathrm{k}=1=\left(\frac{n}{(y) h}\right)=\left(\frac{n}{(10) h}\right)$
$\mathrm{n}_{\mathrm{h}}=\mathrm{y}^{\mathrm{h}}$, but $\mathrm{y}=10$ (figure 5)
$n_{h}=y^{h}=10^{h}$
$\mathrm{n}_{\mathrm{h}}=10^{\mathrm{h}}$
Application of $\mathrm{n}=10^{\mathrm{h}}$ to One Dimension of L, T, M and LitreConversion Model
To determine the starting point to the steps/movements, then $\mathrm{h}=$ 0

From $\mathrm{n}_{\mathrm{h}}=10^{\mathrm{h}}$
$\mathrm{n}_{0}=10^{0}=1$ unit, so the starting point A (figure 5) is 1 unit
To determine the first movement/ step to the right of the starting point A , then $\mathrm{h}=1$
From $\mathrm{n}=10^{\mathrm{h}}$
$\mathrm{n}_{1}=10^{1}=10$ units, so the first movement from the starting point A (figure 5) is a distance of 10 units

To determine the second movement/ step to the right of the starting point A , then $\mathrm{h}=2$
From $\mathrm{n}_{\mathrm{h}}=10^{\mathrm{h}}$
$n_{2}=10^{2}=10 \times 10=100$ units, so the second movement from the starting point A (figure 5) is a distance of 100 units
To determine the third movement/ step to the right of the starting point A , then $\mathrm{h}=3$
From $n_{h}=10^{h}$
$n_{3}=10^{3}=10 \times 10 \times 10=1000$ units, so the third movement from the starting point A (figure 5 ) is a distance of 1000 units
To determine the fourth movement/ step to the right of the starting point A , then $\mathrm{h}=4$
From $\mathrm{n}_{\mathrm{h}}=10^{\mathrm{h}}$
$\mathrm{n}_{4}=10^{4}=10 \times 10 \times 10 \times 10=10000$ units, so the fourth movement from the starting point A (figure 5) is a distance of 10000 units
To determine the fifth movement/ step to the right of the starting point A , then $\mathrm{h}=5$
From $\mathrm{n}_{\mathrm{h}}=10^{\mathrm{h}}$
$\mathrm{n}_{5}=10^{5}=10 \times 10 \times 10 \times 10 \times 10=100000$ units, so the fifth movement from the starting point A (figure 5) is a distance of 100000 units
To determine the sixth movement/ step to the right of the starting point A , then $\mathrm{h}=6$
From $\mathrm{n}_{\mathrm{h}}=10^{\mathrm{h}}$
$n_{6}=10^{6}=10 \times 10 \times 10 \times 10 \times 10 \times 10=1000000$ units, so the sixth movement from the starting point A (figure 5) is a distance of 1000000 units

Figure 4: the Time (T)-Conversion Model

Now a very closer look at figure 4 reveals that, instead of $n=$ $10^{\mathrm{h}}$ as in figures 1,2 and 3 , n now rather becomes $n_{h}=60^{\mathrm{h}}$ in figure 4.
To determine the starting point to the steps/movements, then $\mathrm{h}=$ 0
From $n_{h}=60^{\text {h }}$
$\mathrm{n}_{0}=60^{\circ}=1$ unit, so the starting point s (figure 4 ) is 1 unit
To determine the first movement/ step to the right of the starting point s , then $\mathrm{h}=1$
From $n_{h}=60^{\text {h }}$
$n_{1}=60^{1}=60$ units, so the first movement from the starting point $s$ (figure 4) is a distance of 60 units
To determine the second movement/ step to the right of the starting point s , then $\mathrm{h}=2$
From $n_{h}=60^{\text {h }}$
$n_{2}=60^{2}=60 \times 60=3600$ units, so the second movement from the starting point $s$ (figure 4) is a distance of 3600 units

## Movement In Two Dimensions

The two dimensions of units in the DTML-Conversion model is Area.

Figure 6: the Area (A)-Conversion Model

Figure 7: the proved Diagram for Two DimensionConversion Model

$$
\Longleftrightarrow x_{a} \Rightarrow \quad \mathrm{y}=100
$$

Let $\mathrm{y}=$ equal distance/space between alphabets (figure 7)
$\mathrm{n}=$ the number of steps $/$ movements from the starting point, $\mathrm{mm}^{2}$
$h=$ the index of the spaces between the alphabets i.e. $y^{h}$
From figure 7, n depends on y .
Mathematically,
$\mathrm{n} \propto \mathrm{y}$
Hence, $\mathrm{n}=\mathrm{ky}$, $\mathrm{k}=$ constant of proportionality
Let y be raised to an index h
$\mathrm{n}_{\mathrm{h}}=\mathrm{ky}{ }^{\mathrm{h}}, \mathrm{k} \neq 0$ if $\mathrm{k}=1$
$\mathrm{n}_{\mathrm{h}}=\mathrm{y}^{\mathrm{h}}$, but $\mathrm{y}=100$ (figure 7)
$\mathrm{n}_{\mathrm{h}}=\mathrm{y}^{\mathrm{h}}=100^{\mathrm{h}}$
$\mathrm{n}_{\mathrm{h}}=100^{\mathrm{h}}$
Application of $\mathrm{n}=100^{\mathrm{h}}$ to Two Dimension i.e. Area-Conversion Model
To determine the starting point to the steps/movements, then $\mathrm{h}=$ 0

From $n_{h}=100^{\mathrm{h}}$
$\mathrm{n}_{0}=100^{\circ}=1$ unit, so the starting point $\mathrm{mm}^{2}$ (figure 7) is 1 unit
To determine the first movement/ step to the right of the starting point $\mathrm{mm}^{2}$, then $\mathrm{h}=1$
From $n_{h}=100^{\text {h }}$
$\mathrm{n}_{1}=100^{1}=100$ units, so the first movement from the starting point $\mathrm{mm}^{2}$ (figure 7) is a distance of 100 units
To determine the second movement/ step to the right of the starting point $\mathrm{mm}^{2}$, then $\mathrm{h}=2$
From $n_{h}=100^{\mathrm{h}}$
$n_{2}=100^{2}=100 \times 100=10000$ units, so the second movement from the starting point $\mathrm{mm}^{2}$ (figure 7) is a distance of 10000 units
To determine the third movement/ step to the right of the starting point $\mathrm{mm}^{2}$, then $\mathrm{h}=3$
From $n_{h}=100^{h}$
$\mathrm{n}_{3}=100^{3}=100 \times 100 \times 100=1000000$ units, so the third movement from the starting point $\mathrm{mm}^{2}$ (figure 7) is a distance of 1000000 units.
To determine the fourth movement/ step to the right of the starting point $\mathrm{mm}^{2}$, then $\mathrm{h}=4$
From $\mathrm{n}_{\mathrm{h}}=100^{\mathrm{h}}$
$\mathrm{n}_{4}=100^{4}=100 \times 100 \times 100 \times 100=100000000$ units, so the fourth movement from the starting point $\mathrm{mm}^{2}$ (figure 7) is a distance of 100000000 units
To determine the fifth movement/ step to the right of the starting point $\mathrm{mm}^{2}$, then $\mathrm{h}=5$
From $n_{h}=100^{\mathrm{h}}$
$\mathrm{n}_{5}=100^{5}=100 \times 100 \times 100 \times 100 \times 100=10000000000$ units, so the fifth movement from the starting point $\mathrm{mm}^{2}$ (figure 7) is a distance of 10000000000 units
To determine the sixth movement/ step to the right of the starting point $\mathrm{mm}^{2}$, then $\mathrm{h}=6$
From $\mathrm{n}_{\mathrm{h}}=100^{\mathrm{h}}$
$n_{6}=100^{6}=100 \times 100 \times 100 \times 100 \times 100 \times 100=1000000000000$ units, so the sixth movement from the starting point $\mathrm{mm}^{2}$ (figure 7) is a distance of 1000000000000 units

## Movement in three dimensions

The three dimensions of units in the DTML-Conversion model is Volume.

Figure 8: the Volume (V)-Conversion Model

Figure 9: the Proved Diagram for Three DimensionConversion Model
च X $\Rightarrow \quad y=1000$

Let $\mathrm{y}=$ equal distance/space between alphabets (figure 9)
$\mathrm{n}=$ the number of steps / movements from the starting point, $\mathrm{mm}^{3}$
$\mathrm{h}=$ the index of the spaces between the alphabets i.e. $\mathrm{y}^{\mathrm{h}}$
From figure 9, n depends on y .
Mathematically,
$\mathrm{n} \propto \mathrm{y}$
Hence, $\mathrm{n}=\mathrm{ky}$, $\mathrm{k}=$ constant of proportionality
Let $y$ be raised to an index $h$
$\mathrm{n}_{\mathrm{h}}=\mathrm{ky}^{\mathrm{h}}, \mathrm{k} \neq 0$, if $\mathrm{k}=1$
$\mathrm{n}_{\mathrm{h}}=\mathrm{y}^{\mathrm{h}}$, but $\mathrm{y}=1000$ (figure 9)
$\mathrm{n}_{\mathrm{h}}=\mathrm{y}^{\mathrm{h}}=1000^{\mathrm{h}}$
$\mathrm{n}_{\mathrm{h}}=1000^{\mathrm{h}}$
Application of $\mathrm{n}=1000^{\mathrm{h}}$ to Three Dimension i.e. VolumeConversion Model
To determine the starting point to the steps/movements, then $\mathrm{h}=$ 0
From $n_{h}=1000^{h}$
$\mathrm{n}_{0}=1000^{0}=1$ unit, so the starting point $\mathrm{mm}^{3}$ (figure 9) is 1 unit To determine the first movement/ step to the right of the starting point $\mathrm{mm}^{3}$, then $\mathrm{h}=1$
From $n_{h}=1000^{h}$
$n_{1}=1000^{1}=1000$ units, so the first movement from the starting point $\mathrm{mm}^{3}$ (figure 9) is a distance of 1000 units
To determine the second movement/ step to the right of the starting point $\mathrm{mm}^{3}$, then $\mathrm{h}=2$
From $\mathrm{n}_{\mathrm{h}}=1000^{\mathrm{h}}$
$\mathrm{n}_{2}=1000^{2}=1000 \times 1000=1000000$ units, so the second movement from the starting point $\mathrm{mm}^{3}$ (figure 9) is a distance of 1000000 units

To determine the third movement/ step to the right of the starting point $\mathrm{mm}^{3}$, then $\mathrm{h}=3$
From $n_{h}=1000^{\mathrm{h}}$
$n_{3}=1000^{3}=1000 \times 1000 \times 1000=1000000000$ units, so the third movement from the starting point $\mathrm{mm}^{3}$ (figure 9) is a distance of 1000000000 units
To determine the fourth movement/ step to the right of the starting point $\mathrm{mm}^{3}$, then $\mathrm{h}=4$
From $n_{h}=1000^{h}$
$\mathrm{n}_{4}=1000^{4}=1000 \times 1000 \times 1000 \times 1000=1000000000000$ units, so the fourth movement from the starting point $\mathrm{mm}^{3}$ (figure 9) is a distance of 1000000000000 units
To determine the fifth movement/ step to the right of the starting point $\mathrm{mm}^{3}$, then $\mathrm{h}=5$
From $n_{h}=1000^{\mathrm{h}}$
$\mathrm{n}_{5}=1000^{5}=1000 \times 1000 \times 1000 \times 1000 \times 1000=$ 1000000000000000 units, so the fifth movement from the starting point $\mathrm{mm}^{3}$ (figure 9) is a distance of 1000000000000000 units
To determine the sixth movement/ step to the right of the starting point $\mathrm{mm}^{3}$, then $\mathrm{h}=6$
From $\mathrm{n}_{\mathrm{h}}=1000^{\mathrm{h}}$
$\mathrm{n}_{6}=100^{6}=1000 \times 1000 \times 1000 \times 1000 \times 1000 \times 1000=$ 1000000000000000000 units, so the sixth movement from the starting point $\mathrm{mm}^{3}$ (figure) is a distance of 1000000000000000000 units
Mathematical proof of converting within units with the dtml-conversion model
Let $\mathrm{y}=$ the given unit
$\mathrm{c}=$ the unit in which the given unit is to be converted
$\mathrm{n}=$ the number of steps / movements from the starting point
$d=$ the dimension of a quantity
If, y depends on n .
Mathematically,
$\mathrm{y} \propto \mathrm{n}$
Hence, $\mathrm{y}=\mathrm{cn}, \mathrm{c}=$ constant of proportionality
Let $y$ be raised to an index $d$
$y=\mathrm{cn}^{\mathrm{d}} ; \mathrm{c} \neq 0$, if for one dimension $\mathrm{d}=1$, for two dimension $\mathrm{d}=2$, and for three dimension $\mathrm{d}=3$
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$, if $\mathrm{d}=1$ (one dimension)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{1}=\mathrm{cn}$ (one dimension)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$, if $\mathrm{d}=2$, then $\mathrm{y}=\mathrm{cn}^{2}$ (two dimension; n is the number of steps/movement in the one dimension-conversion model)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{2}=\mathrm{cn}$ (two dimension; n is the actual number of steps in the two dimension-conversion model)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$, if $\mathrm{d}=3$, then $\mathrm{y}=\mathrm{cn}^{3}$ (three dimension; n is the number of steps/movement in the one dimension-conversion model)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{3}=\mathrm{cn}$ (three dimension; n is the actual number of steps in the three dimension-conversion model).

Application of $\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$ to One Dimension of L, M, T and LitreConversion Model
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$, for one dimension, $\mathrm{d}=1$
$y=c n$
Example 1
Convert 2 cm to m
Data:
$\mathrm{y}=$ the given unit (i.e. 2 cm ), $\mathrm{n}=$ number of steps (two steps, $\mathrm{n}_{2}$ $=100$ i.e. converting from cm to m is a two step/movement i.e. $\mathrm{n}_{2}=100$ ), $\mathrm{c}=$ the unit in which the given unit is to be converted Solution
$y=c n$
$2 \mathrm{~cm}=\mathrm{c} \times 100 \mathrm{~cm} / \mathrm{m}$
$\frac{2 \mathrm{~cm}}{100 \mathrm{~cm}} \times 1 \mathrm{~m}=\mathrm{c}$
$0.02 \mathrm{~m}=\mathrm{c}$
Example 2
Change 0.001 g to dg
Data:
$\mathrm{y}=0.001 \mathrm{~g}, \mathrm{n}=1 \div 10$ (moving from g to dg is one movement but it is the reverse of $d g$ to $g$, hence instead of $n=10$, the reverse is $\mathrm{n}=(1 \div 10), \mathrm{c}=$ ?
Solution
$\mathrm{y}=\mathrm{cn}$
$0.001 \mathrm{~g}=\mathrm{c} \times \frac{1}{10 \mathrm{~g} / \mathrm{dg}}$
$\frac{0.001 g}{1 / 10 g} \times 1 \mathrm{dg}=\mathrm{c}$
$0.001 \times 10 \mathrm{dg}=\mathrm{c}$
$0.01 \mathrm{dg}=\mathrm{c}$
Example 3
Convert 534 kL to mL
Data:
$\mathrm{y}=534 \mathrm{~kL}, \mathrm{n}=1 \div 1000000$ (moving from kL to mL is six steps/movement but it is the reverse of mL to kL , hence instead of $\mathrm{n}=1000000$, the reverse is $\mathrm{n}=(1 \div 1000000), \mathrm{c}=$ ?
Solution
$\mathrm{y}=\mathrm{cn}$
$534 \mathrm{~kL}=\mathrm{c} \times \frac{1}{1000000 \mathrm{~kL} / \mathrm{mL}}$
$\frac{543 \mathrm{~kL}}{\frac{1}{1000000 \mathrm{~kL} / \mathrm{mL}}}=\mathrm{c}$
$534 \times 1000000 \mathrm{~mL}=\mathrm{c}$
$534000000 \mathrm{~mL}=\mathrm{c}$
Example 4
Change 200s to hr.
Data:
$\mathrm{y}=200 \mathrm{~s}, \mathrm{n}=3600$ (moving from s to hr is two steps/movements), $\mathrm{c}=$ ?
Solution
$\mathrm{y}=\mathrm{cn}$
$200=c \times(3600) \mathrm{s} / \mathrm{hr}$
$\frac{200 s}{3600 s} \times 1 \mathrm{hr}=\mathrm{c}$
$\frac{200}{3600 s} h r=c$
$0.056 \mathrm{hr}=\mathrm{c}$
Application of $\mathrm{y}=\mathrm{cn}^{2}$ to Two Dimension i.e. Area (A)Conversion Model
Example 1
Convert $2 \mathrm{~cm}^{2}$ to $\mathrm{m}^{2}$
Data:
$\mathrm{y}=$ the given unit (i.e. $2 \mathrm{~cm}^{2}$ ), $\mathrm{n}=$ number of steps (two steps, $\mathrm{n}_{2}$ $=10000=n_{2 \#}^{2}=100^{2}$ i.e. $n_{2 \#}$ is the two step / movement in the one dimension-conversion model, also converting from $\mathrm{cm}^{2}$ to $\mathrm{m}^{2}$ is a two step/movement i.e. $\left.\mathrm{n}_{2}=10000\right), \mathrm{c}=$ the unit in which the given unit is to be converted.

## Solution

By using $\mathrm{n}_{2 \#}=100$ (two step / movement in the one dimensionconversion model)
$y=c n^{d}$, for two dimension, $d=2$
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{2}$
$2 \mathrm{~cm}^{2}=\mathrm{c} \times \mathrm{n}_{2 \#}^{2}=\mathrm{c} \times 100^{2} \mathrm{~cm}^{2} / \mathrm{m}^{2}$
$2 \mathrm{~cm}^{2}=\mathrm{c} \times 10000 \mathrm{~cm}^{2} / \mathrm{m}^{2}$
$\left(\frac{2}{10000} \mathrm{~cm}^{2} / \mathrm{cm}^{2}\right) \times 1 \mathrm{~m}^{2}=\mathrm{c}$
$\frac{2}{10000} \mathrm{~m}^{2}=\mathrm{c}$
$0.0002 \mathrm{~m}^{2}=\mathrm{c}$
By using $\mathrm{n}_{2}=10000$ (actual two step / movement in the two dimension-conversion model)
$\mathrm{y}=\mathrm{cn}_{2}$
$2 \mathrm{~cm}^{2}=\mathrm{c} \times 10000 \mathrm{~cm}^{2} / \mathrm{m}^{2}$
$\left(\frac{2}{10000} \mathrm{~cm}^{2} / \mathrm{cm}^{2}\right) \times 1 \mathrm{~m}^{2}=\mathrm{c}$
$0.0002 \mathrm{~m}^{2}=\mathrm{c}$
Example 2
Convert $2 \mathrm{~m}^{2}$ to $\mathrm{cm}^{2}$
Data:
$\mathrm{y}=$ the given unit (i.e. $2 \mathrm{~m}^{2}$ ), $\mathrm{n}=$ number of steps (two steps in a reverse direction i.e. from $\mathrm{m}^{2}$ to $\mathrm{cm}^{2}, \mathrm{n}_{2}=1 \div 10000=\mathrm{n}_{2 \#}^{2}=$ $(1 \div 100)^{2}$ i.e. $\mathrm{n}_{2 \#}$ is the two step / movement in the one dimension-conversion model, also converting from $\mathrm{m}^{2}$ to $\mathrm{cm}^{2}$ is a two step/movement but in a reversed direction i.e. $\mathrm{n}_{2}=$ $1 \div 10000, \mathrm{c}=$ the unit in which the given unit is to be converted. Solution
By using $\mathrm{n}_{2 \#}=\frac{2}{100}$ (two step / movement in the one dimensionconversion model)
$y=c^{d}$, for two dimension, $d=2$
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{2}$
$2 \mathrm{~m}^{2}=\mathrm{c} \times \mathrm{n}_{2 \#}^{2}=\mathrm{c} \times\left(1 \div 100^{2}\right) \mathrm{m}^{2} / \mathrm{cm}^{2}$
$2 \mathrm{~m}^{2}=\mathrm{c} \times 10000 \mathrm{~m}^{2} / \mathrm{cm}^{2}$
$\left[\frac{2}{\left(\frac{1}{100}\right) 2} \mathrm{~m}^{2} / \mathrm{m}^{2}\right] \times 1 \mathrm{~cm}^{2}=\mathrm{c}$
$2 \times 10000 \mathrm{~cm}^{2}=\mathrm{c}$
$20000 \mathrm{~cm}^{2}=\mathrm{c}$
By using $\mathrm{n}_{2}=\frac{1}{1000}$ (actual two step / movement in the two dimension-conversion model)
$\mathrm{y}=\mathrm{cn}_{2}$
$2 \mathrm{~m}^{2}=\mathrm{c} \times\left(\frac{1}{1000}\right) \mathrm{m}^{2} / \mathrm{cm}^{2}$
$\left(2 \mathrm{~m}^{2} \times 10000 \mathrm{~m}^{2}\right) \times 1 \mathrm{~cm}^{2}=\mathrm{c}$
$20000 \mathrm{~cm}^{2}=\mathrm{c}$
Application of $\mathrm{y}=\mathrm{cn}^{3}$ to Three Dimension i.e. Volume (V)Conversion Model
Example 1
Convert $2 \mathrm{~cm}^{3}$ to $\mathrm{m}^{3}$
Data:
$\mathrm{y}=$ the given unit (i.e. $2 \mathrm{~cm}^{3}$ ), $\mathrm{n}=$ number of steps (two steps, $\mathrm{n}_{2}$ $=1000000$ i.e. $1000 \times 1000=n_{2 \#}^{3}=100^{3}$ i.e. $n_{2 \#}$ is the two step / movement in the one dimension-conversion model, also converting from $\mathrm{cm}^{3}$ to $\mathrm{m}^{3}$ is a two step/movement i.e. $\mathrm{n}_{2}=$ $1000000, \mathrm{c}=$ the unit in which the given unit is to be converted. Solution
By using $\mathrm{n}_{2 \#}=100$ (two step / movement in the one dimensionconversion model)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$, for three dimension, $\mathrm{d}=3$
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{3}$
$2 \mathrm{~cm}^{3}=\mathrm{c} \times \mathrm{n}_{2 \#}{ }^{3}=\mathrm{c} \times 100^{3} \mathrm{~cm}^{3} / \mathrm{m}^{3}$
$2 \mathrm{~cm}^{3}=\mathrm{c} \times 1000000 \mathrm{~cm}^{3} / \mathrm{m}^{3}$
$\left(\frac{2}{1000000} \mathrm{~cm}^{3} / \mathrm{cm}^{3}\right) \times 1 \mathrm{~m}^{3}=\mathrm{c}$
$\frac{2}{1000000} \mathrm{~m}^{3}=\mathrm{c}$
$0.000002 \mathrm{~m}^{3}=\mathrm{c}$
By using $\mathrm{n}_{2}=1000000$ (actual two step / movement in the three dimension-conversion model)
$\mathrm{y}=\mathrm{cn}_{2}$
$2 \mathrm{~cm}^{3}=\mathrm{c} \times 1000000 \mathrm{~cm}^{3} / \mathrm{m}^{3}$
$\left(\frac{2}{1000000} \mathrm{~cm}^{3} / \mathrm{cm}^{3}\right) \times 1 \mathrm{~m}^{3}=\mathrm{c}$
$0.000002 \mathrm{~m}^{3}=\mathrm{c}$
Example 2
Convert $2 \mathrm{~m}^{3}$ to $\mathrm{cm}^{3}$
Data:
$\mathrm{y}=$ the given unit (i.e. $2 \mathrm{~m}^{3}$ ), $\mathrm{n}=$ number of steps (two steps but in a reversed movement, $\mathrm{n}_{2}=1 \div 1000000$ i.e. $=\mathrm{n}_{2 \#}{ }^{3}=1 \div 100^{3}$ i.e. $\mathrm{n}_{2 \#}$ is the reversed two step / movement in the one dimensionconversion model, also converting from $\mathrm{m}^{3}$ to $\mathrm{cm}^{3}$ is a reversed two step/movement i.e. $\mathrm{n}_{2}=1000000, \mathrm{c}=$ the unit in which the given unit is to be converted.
Solution
By using $\mathrm{n}_{2 \#}=\frac{1}{100}$ (two step / movement in the one dimensionconversion model)
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}$, for three dimension, $\mathrm{d}=3$
$\mathrm{y}=\mathrm{cn}^{\mathrm{d}}=\mathrm{cn}^{3}$
$2 \mathrm{~m}^{3}=\mathrm{c} \times \mathrm{n}_{2 \#}{ }^{3}=\mathrm{c} \times\left(1 \div 100^{3}\right) \mathrm{m}^{3} / \mathrm{cm}^{3}$
$2 \mathrm{~m}^{3}=\mathrm{c} \times \frac{1}{1000000} \mathrm{~cm}^{3} / \mathrm{m}^{3}$
$\left(2 \mathrm{~m}^{3} \times 1000000 \mathrm{~m}^{3}\right) \times 1 \mathrm{~cm}^{3}=\mathrm{c}$
$2 \times 1000000 \mathrm{~cm}^{3}=\mathrm{c}$
$2000000 \mathrm{~cm}^{3}=\mathrm{c}$
By using $\mathrm{n}_{2}=\frac{1}{1000000}$ (actual two step / movement in the three
dimension-conversion model)
$\mathrm{y}=\mathrm{cn}_{2}$
$2 \mathrm{~m}^{3}=\mathrm{c} \times \frac{1}{1000000} \mathrm{~m}^{3} / \mathrm{cm}^{3}$
$\left(2 \mathrm{~m}^{3} \times 1000000 \mathrm{~m}^{3}\right) \times 1 \mathrm{~cm}^{3}=\mathrm{c}$
$2000000 \mathrm{~cm}^{3}=$
C
