Fuzzy subset,
Q-fuzzy subset,
Q-fuzzysubgroup,
Q-homomorphism,
Q-antihomomorphism,
Strongest Q-fuzzy relation.

## Introduction

After the introdution of fuzzy sets by L.A.Zadeh [18], several researchers explored on the generalization of the notion of fuzzy set. Azriel Rosenfeld [3] defined a Fuzzy groups. Anthony.J.M. and Sherwood.H[2] defined a fuzzy groups redefined. Choudhury.F.P. and Chakraborty.A.B. and Khare.S.S.[5] defined a fuzzy subgroups and fuzzy homomorphism. A.Solairaju and R.Nagarajan[14] have introduced and defined a new algebraic structure called Q-fuzzy subgroups. We introduce the concept of Q-homomorphism in Qfuzzy subgroups and established some results.

## Preliminaries:

Definition: Let X be a non-empty set. A fuzzy subset A of X is a function $\mathrm{A}: \mathrm{X} \rightarrow[0,1]$.
Definition: Let X be a non-empty set and Q be a non-empty set. A Q -fuzzy subset A of X is a function $\mathrm{A}: \mathrm{XxQ} \rightarrow[0,1]$.
Example: Let $X=\{a, b, c\}$ be a set and $Q=\{p\}$. Then $A=\{$ $\langle(\mathrm{a}, \mathrm{p}), 0.4\rangle,\langle(\mathrm{b}, \mathrm{p}), 0.2\rangle,\langle(\mathrm{c}, \mathrm{p}), 0.5\rangle\}$ is a Q-fuzzy subset of X.
Definition: The union of two Q-fuzzy subsets A and B of a set $X$ is defined by $(A \cup B)(x, q)=\max \{A(x, q), B(x, q)\}$, for all $x$ in $X$ and $q$ in Q .
Definition: The intersection of two Q-fuzzy subsets A and B of a set $X$ is defined by $(A \cap B)(x, q)=\min \{A(x, q), B(x, q)\}$, for all $x$ in $X$ and $q$ in $Q$.
Definition: If ( $\mathrm{G},$. ) and $\left(\mathrm{G}^{\prime},.\right)$ are any two groups and Q be a non-empty set, then the function $f: G x Q \rightarrow G^{1} x Q$ is called a $Q-$ homomorphism if $f(x y, q)=f(x, q) f(y, q)$, for all $x$ and $y$ in $G$ and $q$ in Q .
Definition: If ( $\mathrm{G},$. ) and $\left(\mathrm{G}^{\prime},.\right)$ are any two groups and Q be a non-empty set, then the function $f: G x Q \rightarrow G^{\prime} x Q$ is called a $Q-$ antihomomorphism if $f(x y, q)=f(y, q) f(x, q)$, for all $x$ and $y$ in G and q in Q .
Definition: Let ( $\mathrm{G}, \cdot$ ) be a group and Q be a set. A Q-fuzzy subset A of G is said to be a Q-fuzzy subgroup(QFSG) of G if the following conditions are satisfied:

#### Abstract

In this paper, we study the Q-homomorphism in Q-fuzzy subgroup and prove some results on these.

(i) $\mathrm{A}(\mathrm{xy}, \mathrm{q}) \geq \min \{\mathrm{A}(\mathrm{x}, \mathrm{q}), \mathrm{A}(\mathrm{y}, \mathrm{q})\}$,
(ii) $A\left(x^{-1}, q\right) \geq A(x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$.

Definition: Let $(\mathrm{G}, \cdot)$ and $\left(\mathrm{G}^{\prime}, \cdot \cdot\right)$ be any two groups and Q be a set. Let $\mathrm{f}: \mathrm{GxQ} \rightarrow \mathrm{G}^{\prime} \mathrm{xQ}$ be any function and $A$ be a Q -fuzzy subgroup in $G, V$ be a $Q$-fuzzy subgroup in $f(G x Q)=G^{\prime} x Q$, defined by $V(y, q)=\sup A(x, q)$, for all $x$ in $G$ and $y$ in $G^{\prime}$ and q in Q . Then A is called a preimage of V under f and is denoted by $\mathrm{f}^{-1}(\mathrm{~V})$.
Definition: Let A and B be any two Q-fuzzy subsets of sets G and $H$, respectively. The product of $A$ and $B$, denoted by $A x B$, is defined as $A x B=\{\langle((x, y), q), \operatorname{AxB}((x, y), q)\rangle /$ for all $x$ in $G$ and $y$ in $H$ and $q$ in $Q\}$, where $A x B((x, y), q)=\min \{A(x$, q), $B(y, q)\}$.

Definition: Let A and B be any two Q-fuzzy subgroups of a group ( $\mathrm{G}, \cdot$ ). Then A and B are said to be conjugate Q-fuzzy subgroups of $G$ if for some $g$ in $G, A(x, q)=B\left(g^{-1} x g, q\right)$, for every x in G and q in Q .
Definition: Let A be a Q-fuzzy subset in a set S , the strongest Q-fuzzy relation on $S$, that is a Q -fuzzy relation on A is V given by $V((x, y), q)=\min \{A(x, q), A(y, q)\}$, for all $x$ and $y$ in $S$ and $q$ in $Q$.
Proposition: Let A be a Q-fuzzy subgroup of a group G. If $A(x, q)<A(y, q)$, for some $x$ and $y$ in $G$ and $q$ in $Q$, then $A(x y$, $q)=A(x, q)=A(y x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$.
proof: Let A be a Q-fuzzy subgroup of a group G. Also we have $A(x, q)<A(y, q)$, for some $x$ and $y$ in $G$ and $q$ in $Q, A(x y$, $q) \geq \min \{A(x, q), A(y, q)\}=A(x, q) ;$ and $A(x, q)=A\left(x y y^{-1}\right.$, $q) \geq \min \left\{A(x y, q), A\left(y^{-1}, q\right)\right\} \geq \min \{A(x y, q), A(y, q)\}=$ $A(x y, q)$. Therefore, $A(x y, q)=A(x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$. And, $A(y x, q) \geq \min \{A(y, q), A(x, q)\}=A(x, q) ;$ and $A(x, q)=A\left(y^{-1} y x, q\right) \geq \min \left\{A\left(y^{-1}, q\right), A(y x, q)\right\} \geq \min \{A(y$, q), $A(y x, q)\}=A(y x, q)$.

Therefore, $A(y x, q)=A(x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$. Hence $A(x y, q)=A(x, q)=A(y x, q)$, for all $x$ and $y$ in $G$ and q in Q .

Proposition: Let A be a Q-fuzzy subgroup of a group G. If A(x, $q)>A(y, q)$, for some $x$ and $y$ in $G$ and $q$ in $Q$, then $A(x y, q)=$ $A(y, q)=A(y x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$.
Proof: It is trivial.
Proposition: Let A be a Q-fuzzy subgroup of a group G such that $\operatorname{Im} A=\{\alpha\}$, where $\alpha$ in $[0,1]$. If $A=B \cup C$, where $B$ and $C$ are $Q$-fuzzy subgroups of $G$, then either $B \subseteq C$ or $C \subseteq B$.
Proof: Let $A=B \cup C=\{\langle(x, q), A(x, q)\rangle / x$ in $G$ and $q$ in $Q\}$, $B=\{\langle(x, q), B(x, q)\rangle / x$ in $G$ and $q$ in $Q\}$ and $C=\{\langle(x, q)$, $\mathrm{C}(\mathrm{x}, \mathrm{q})\rangle / \mathrm{x}$ in G and q in Q$\}$. Assume that $\mathrm{B}(\mathrm{x}, \mathrm{q})>\mathrm{C}(\mathrm{x}, \mathrm{q})$ and $\mathrm{B}(\mathrm{y}, \mathrm{q})<\mathrm{C}(\mathrm{y}, \mathrm{q})$, for some x and y in G and q in Q . Then, $\alpha=$ $A(x, q)=B \cup C(x, q)=\max \{B(x, q), C(x, q)\}=B(x, q)>C(x$, q). Therefore, $\alpha>C(x, q)$. And, $\alpha=A(y, q)=B \cup C(y, q)=\max \{$ $B(y, q), C(y, q)\}=C(y, q)>B(y, q)$. Therefore, $\alpha>B(y, q)$. So that, $C(y, q)>C(x, q)$ and $B(x, q)>B(y, q)$. Hence $B(x y, q)=$ $B(y, q)$ and $C(x y, q)=C(x, q)$, by Proposition 1.1 and 1.2. But then, $\alpha=A(x y, q)=B \cup C(x, q)=\max \{B(x y, q), C(x y, q)\}=$ $\max \{B(y, q), C(x, q)\}<\alpha--------(1)$. It is a contradiction by (1).

Therefore, either $\mathrm{B} \subseteq \mathrm{C}$ or $\mathrm{C} \subseteq \mathrm{B}$ is true.
Proposition: If A and B are Q-fuzzy subgroups of the groups G and $H$, respectively, then AxB is a Q-fuzzy subgroup of GxH. Proof: Let A and B be Q-fuzzy subgroups of the groups G and H respectively.
Let $x_{1}$ and $x_{2}$ be in $G, y_{1}$ and $y_{2}$ be in $H$. Then ( $x_{1}, y_{1}$ ) and ( $x_{2}$, $\left.y_{2}\right)$ are in GxH. Now, $\operatorname{AxB}\left[\left(x_{1}, y_{1}\right)\left(x_{2}, y_{2}\right), q\right]=\operatorname{AxB}\left(\left(x_{1} x_{2}\right.\right.$, $\left.\left.y_{1} y_{2}\right), q\right)=\min \left\{A\left(x_{1} x_{2}, q\right), B\left(y_{1} y_{2}, q\right)\right\} \geq \min \left\{\min \left\{A\left(x_{1}, q\right)\right.\right.$, $\left.\left.A\left(x_{2}, q\right)\right\}, \min \left\{B\left(y_{1}, q\right), B\left(y_{2}, q\right)\right\}\right\}=\min \left\{\min \left\{A\left(x_{1}, q\right), B\left(y_{1}\right.\right.\right.$, q) $\left.\}, \min \left\{A\left(x_{2}, q\right), B\left(y_{2}, q\right)\right\}\right\}=\min \left\{A x B\left(\left(x_{1}, y_{1}\right), q\right), A x B(\right.$ $\left.\left.\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right), \mathrm{q}\right)\right\}$. Therefore, $\operatorname{AxB}\left[\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right), \mathrm{q}\right] \geq \min \{\operatorname{AxB}$ $\left.\left(\left(x_{1}, y_{1}\right), q\right), \operatorname{AxB}\left(\left(x_{2}, y_{2}\right), q\right)\right\}$. And $\operatorname{AxB}\left[\left(x_{1}, y_{1}\right)^{-1}, q\right]=\operatorname{AxB}($ $\left.\left(\mathrm{x}_{1}{ }^{-1}, \mathrm{y}_{1}{ }^{-1}\right), \mathrm{q}\right)=\min \left\{\mathrm{A}\left(\mathrm{x}_{1}{ }^{-1}, \mathrm{q}\right), \mathrm{B}\left(\mathrm{y}_{1}{ }^{-1}, \mathrm{q}\right)\right\} \geq \min \left\{\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{q}\right)\right.$, $\left.B\left(y_{1}, q\right)\right\}=\operatorname{AxB}\left(\left(x_{1}, y_{1}\right), q\right)$. Therefore, $\operatorname{AxB}\left[\left(x_{1}, y_{1}\right)^{-1}, q\right] \geq$ AxB ( $\left.\left(x_{1}, y_{1}\right), q\right)$. Hence AxB is a Q-fuzzy subgroup of GxH.
Proposition: Let a Q-fuzzy subgroup $A$ of a group $G$ be conjugate to a Q -fuzzy subgroup M of G and a Q -fuzzy subgroup B of a group H be conjugate to a Q-fuzzy subgroup N of H. Then a Q-fuzzy subgroup AxB of a group GxH is conjugate to a Q-fuzzy subgroup MxN of GxH.
Proof: Let A and B be Q-fuzzy subgroups of the groups G and H respectively.
Let $\mathrm{x}, \mathrm{x}^{-1}$ and f be in G and $\mathrm{y}, \mathrm{y}^{-1}$ and g be in H . Then $(\mathrm{x}, \mathrm{y})$, ( $\mathrm{x}^{-}$ $\left.{ }^{1}, y^{-1}\right)$ and (f,g) are in GxH. Now, $\operatorname{AxB}((f, g), q)=\min \{A(f$, $q), B(g, q)\}=\min \left\{M\left(x f x^{-1}, q\right), N\left(\operatorname{yg~y}^{-1}, q\right)\right\}=\operatorname{MxN}\left(\left(\operatorname{xfx}^{-1}\right.\right.$, $\left.\left.y g y^{-1}\right), q\right)=\operatorname{MxN}\left[(x, y)(f, g)\left(x^{-1}, y^{-1}\right), q\right]=\operatorname{MxN}[(x, y)(f$, $\left.\mathrm{g})(\mathrm{x}, \mathrm{y})^{-1}, \mathrm{q}\right]$. Therefore, $\operatorname{AxB}((\mathrm{f}, \mathrm{g}), \mathrm{q})=\operatorname{MxN}[(\mathrm{x}, \mathrm{y})(\mathrm{f}$, $\left.\mathrm{g})(\mathrm{x}, \mathrm{y})^{-1}, \mathrm{q}\right]$. Hence a Q-fuzzy subgroup AxB of GxH is conjugate to a Q-fuzzy subgroup MxN of GxH .
Proposition: Let A and B be Q-fuzzy subsets of the groups G and $H$, respectively. Suppose that e and e 'are the identity element of G and H , respectively. If AxB is a Q -fuzzy subgroup of GxH , then at least one of the following two statements must hold.
(i) $\mathrm{B}\left(\mathrm{e}^{\mathrm{l}}, \mathrm{q}\right) \geq \mathrm{A}(\mathrm{x}, \mathrm{q})$, for all x in G and q in Q ,
(ii) $A(e, q) \geq B(y, q)$, for all $y$ in $H$ and $q$ in $Q$.

Proof: Let AxB is a Q-fuzzy subgroup of GxH. By contraposition, suppose that none of the statements (i) and (ii) holds. Then we can find $a$ in $G$ and $b$ in $H$ such that $A(a, q)>$ $B\left(e^{\prime}, q\right)$ and $B(b, q)>A(e, q), q$ in $Q$. We have, $\operatorname{AxB}((a, b), q)=\min \{A(a, q), B(b, q)\}>\min \left\{A(e, q), B\left(e^{\prime}, q\right)=\right.$ $\operatorname{AxB}\left(\left(e, e^{\prime}\right), q\right)$.

Thus AxB is not a Q-fuzzy subgroup of GxH. Hence either $B\left(e^{\prime}\right.$, $q) \geq A(x, q)$, for all $x$ in $G$ and $q$ in $Q$ or $A(e, q) \geq B(y, q)$, for all y in H and q in Q .
Proposition: Let A and B be Q-fuzzy subsets of the groups G and H , respectively and AxB is a Q-fuzzy subgroup of GxH. Then the following are true:
(i) if $A(x, q) \leq B\left(e^{\prime}, q\right)$, then $A$ is a Q-fuzzy subgroup of $G$.
(ii) if $B(x, q) \leq A(e, q)$, then $B$ is a Q-fuzzy subgroup of $H$.
(iii) either A is a Q-fuzzy subgroup of G or B is a Q-fuzzy subgroup of H .
Proof: Let AxB be a Q-fuzzy subgroup of $G x H$, $x$ and $y$ in $G$ and $q$ in $Q$. Then ( $x, e^{\prime}$ ) and ( $y, e^{\prime}$ ) are in GxH. Now, using the property $\mathrm{A}(\mathrm{x}, \mathrm{q}) \leq \mathrm{B}\left(\mathrm{e}^{\prime}, \mathrm{q}\right)$, for all x in G and q in Q , we get, $A\left(x y^{-1}, q\right)=\min \left\{A\left(x y^{-1}, q\right), B\left(e^{1} e^{1}, q\right)\right\}=A x B\left(\left(\left(x y^{-1}\right),\left(e^{1} e^{\prime}\right)\right.\right.$ $), q)=\operatorname{AxB}\left[\left(x, e^{1}\right)\left(y^{-1}, e^{1}\right), q\right] \geq \min \left\{\operatorname{AxB}\left(\left(x, e^{1}\right), q\right), \operatorname{AxB}(\right.$ $\left.\left.\left(y^{-1}, e^{1}\right), q\right)\right\}=\min \left\{\min \left\{A(x, q), B\left(e^{1}, q\right)\right\}, \min \left\{A\left(y^{-1}, q\right), B\left(e^{\prime}\right.\right.\right.$, q) $\}\}=\min \left\{A(x, q), A\left(y^{-1}, q\right)\right\} \geq \min \{A(x, q), A(y, q)\}$. Therefore, $A\left(x y^{-1}, q\right) \geq \min \{A(x, q), A(y, q)\}$, for all $x, y$ in $G$ and q in Q.Hence A is a Q-fuzzy subgroup of G.
Thus (i) is proved.
Now, using the property $\mathrm{B}(\mathrm{x}, \mathrm{q}) \leq \mathrm{A}(\mathrm{e}, \mathrm{q})$, for all x in H and q in $Q$, we get, $B\left(x y^{-1}, q\right)=\min \left\{B\left(x y^{-1}, q\right), A(e e, q)\right\}=A x B(($ (ee) , $\left.\left.\left(\mathrm{xy}^{-1}\right)\right), \mathrm{q}\right)=\operatorname{AxB}\left[(\mathrm{e}, \mathrm{x})\left(\mathrm{e}, \mathrm{y}^{-1}\right), \mathrm{q}\right] \geq \min \{\operatorname{AxB}((\mathrm{e}, \mathrm{x})$, q), $\left.\operatorname{AxB}\left(\left(e, y^{-1}\right), q\right)\right\}=\min \left\{\min \{B(x, q), A(e, q)\}, \min \left\{B\left(y^{-1}\right.\right.\right.$, q), $A(e, q)\}\}=\min \left\{B(x, q), B\left(y^{-1}, q\right)\right\} \geq \min \{B(x, q), B(y, q)$ \}. Therefore, $B\left(x y^{-1}, q\right) \geq \min \{B(x, q), B(y, q)\}$, for all $x$ and $y$ in H and q in Q . Hence B is a Q-fuzzy subgroup of H .
Thus (ii) is proved. (iii) is clear.
Proposition: Let A be a Q-fuzzy subset of a group $G$ and $V$ be the strongest Q -fuzzy relation of G . Then A is a Q -fuzzy subgroup of G if and only if V is a Q -fuzzy subgroup of GxG .
Proof: Suppose that A is a Q-fuzzy subgroup of G. Then for any $\mathrm{x}=\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)$ and $\mathrm{y}=\left(\mathrm{y}_{1}, \mathrm{y}_{2}\right)$ are in GxG. We have, $\mathrm{V}((\mathrm{x}-\mathrm{y}), \mathrm{q})=$ $\mathrm{V}\left[\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)-\left(\mathrm{y}_{1}, \mathrm{y}_{2}\right), \mathrm{q}\right]=\mathrm{V}\left(\left(\mathrm{x}_{1}-\mathrm{y}_{1}, \mathrm{x}_{2}-\mathrm{y}_{2}\right), \mathrm{q}\right)=\min \left\{\mathrm{A}\left(\left(\mathrm{x}_{1}-\right.\right.\right.$ $\left.\left.\left.y_{1}\right), q\right), \quad A\left(\left(x_{2}-y_{2}\right), q\right)\right\} \geq \min \left\{\min \left\{A\left(x_{1}, q\right), A\left(y_{1}, q\right)\right\}\right.$, $\left.\min \left\{A\left(x_{2}, q\right), A\left(y_{2}, q\right)\right\}\right\}=\min \left\{\min \left\{A\left(x_{1}, q\right), A\left(x_{2}, q\right)\right\}\right.$, $\left.\min \left\{A\left(y_{1}, q\right), A\left(y_{2}, q\right)\right\}\right\}=\min \left\{V\left(\left(x_{1}, x_{2}\right), q\right), V\left(\left(y_{1}, y_{2}\right), q\right)\right\}$ $=\min \{V(x, q), V(y, q)\}$. Therefore, $V((x-y), q) \geq \min \{V$ $(\mathrm{x}, \mathrm{q}), \mathrm{V}(\mathrm{y}, \mathrm{q})$ \}, for all x and y in GxG and q in Q . This proves that $V$ is a Q-fuzzy subgroup of GxG. Conversely, assume that V is a Q-fuzzy subgroup of GxG, then for any $\mathrm{x}=\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)$ and y $=\left(y_{1}, y_{2}\right)$ are in $G x G$, we have $\min \left\{A\left(\left(x_{1}-y_{1}\right), q\right), A\left(\left(x_{2}-\right.\right.\right.$ $\left.\left.\left.y_{2}\right), q\right)\right\}=V\left(\left(x_{1}-y_{1}, x_{2}-y_{2}\right), q\right)=V\left[\left(x_{1}, x_{2}\right)-\left(y_{1}, y_{2}\right), q\right]$ $=V((x-y), q) \geq \min \{V(x, q), V(y, q)\}=\min \left\{V\left(\left(x_{1}, x_{2}\right)\right.\right.$, $\left.\mathrm{q}), \mathrm{V}\left(\left(\mathrm{y}_{1}, \mathrm{y}_{2}\right), \mathrm{q}\right)\right\}=\min \left\{\min \left\{\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{q}\right), \mathrm{A}\left(\mathrm{x}_{2}, \mathrm{q}\right)\right\}, \min \left\{\mathrm{A}\left(\mathrm{y}_{1}\right.\right.\right.$, q), $\left.A\left(y_{2}, q\right)\right\}$.

If we put $x_{2}=y_{2}=0$, we get, $A\left(\left(x_{1}-y_{1}\right), q\right) \geq \min \left\{A\left(x_{1}, q\right)\right.$, $A\left(y_{1}, q\right)$, for all $x_{1}$ and $y_{1}$ in $G$ and $q$ in $Q$. Hence $A$ is a Q-fuzzy subgroup of G.
Proposition: Let ( $\mathrm{G}, \cdot$ ) and ( $\mathrm{G}^{\prime}, \cdot$ ) be any two groups and Q be a non-empty set. The Q -homomorphic image of a Q-fuzzy subgroup of G is a Q-fuzzy subgroup of $\mathrm{G}^{\mathrm{l}}$.
Proof: Let ( $\mathrm{G}, \cdot$ ) and ( $\mathrm{G}^{\prime}, \cdot$ ) be any two groups and Q be a non-empty set and $f: G x Q \rightarrow G^{\prime} x Q$ be a $Q$-homomorphism. That is $f(x y, q)=f(x, q) f(y, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$. Let $\mathrm{V}=\mathrm{f}(\mathrm{A})$, where A is a Q -fuzzy subgroup of G . We have to prove that $V$ is a Q-fuzzy subgroup of $G^{\prime}$. Now, for $f(x, q)$ and $f(y, q)$ in $G^{\prime} x Q$, we have $V(f(x, q) f(y, q))=V(f(x y, q)) \geq A(x y, q) \geq$ $\min \{A(x, q), A(y, q)\}$ which implies that $V(f(x, q) f(y, q)) \geq$ $\min \{V(f(x, q)), V(f(y, q))\}$. For $f(x, q)$ in $G^{\prime} x Q$, we have $V($ $\left.[f(x, q)]^{-1}\right)=V\left(f\left(x^{-1}, q\right)\right) \geq A\left(x^{-1}, q\right) \geq A(x, q)$ which implies
that $V\left([f(x, q)]^{-1}\right) \geq V(f(x, q))$. Hence $V$ is a $Q$-fuzzy subgroup of a group $\mathrm{G}^{\prime}$.
Proposition: Let ( $\mathrm{G}, \cdot$ ) and ( $\mathrm{G}^{\prime}, \cdot$ ) be any two groups and Q be a non-empty set. The Q-homomorphic pre-image of a Qfuzzy subgroup of $\mathrm{G}^{\prime}$ is a Q-fuzzy subgroup of G .
Proof: Let ( $\mathrm{G}, \cdot$ ) and ( $\left.\mathrm{G}^{\prime}, \cdot\right)$ be any two groups and Q be a non-empty set and $f: G x Q \rightarrow G^{\prime} x Q$ be a Q -homomorphism. That is $f(x y, q)=f(x, q) f(y, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$. Let $V=f(A)$, where $V$ is a $Q$-fuzzy subgroup of $G^{\prime}$. We have to prove that A is a Q-fuzzy subgroup of G. Let $x$ and $y$ in $G$ and $q$ in $Q$. Then, $A(x y, q)=V(f(x y, q))=V(f(x, q) f(y, q)) \geq \min \{V(f(x$, q) $), V(f(y, q))\}=\min \{A(x, q), A(y, q)\}$ which implies that $\mathrm{A}(\mathrm{xy}, \mathrm{q}) \geq \min \{\mathrm{A}(\mathrm{x}, \mathrm{q}), \mathrm{A}(\mathrm{y}, \mathrm{q})\}$, for x and y in G and q in Q . And $A\left(x^{-1}, q\right)=V\left(f\left(x^{-1}, q\right)\right) \quad=V\left([f(x, q)]^{-1}\right) \geq V(f(x, q))=$ $A(x, q)$ which implies that $A\left(x^{-1}, q\right) \geq A(x, q)$, for $x$ in $G$ and $q$ in Q . Hence A is a Q -fuzzy subgroup of a groupG.
Proposition: Let ( $\mathrm{G}, \cdot$ ) and ( $\mathrm{G}^{\prime}, \cdot$ ) be any two groups and Q be a non-empty set. The Q-antihomomorphic image of a Qfuzzy subgroup of G is a Q-fuzzy subgroup of $\mathrm{G}^{\prime}$.
Proof: Let ( $\mathrm{G}, \cdot$ ) and ( $\mathrm{G}^{1}, \cdot$ ) be any two groups and Q be a set and $f: G x Q \rightarrow G^{\prime} x Q$ be a $Q$-antihomomorphism. That is $f(x y, q)$ $=f(y, q) f(x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$. Let $V=f(A)$, where $A$ is a Q -fuzzy subgroup of G . We have to prove that V is a Q-fuzzy subgroup of $G^{\prime}$. Now, let $f(x, q)$ and $f(y, q)$ in $G^{\prime} x Q$, we have $V(f(x, q) f(y, q))=V(f(y x, q)) \geq A(y x, q) \geq \min \{A(x$, q), $A(y, q)\}$ which implies that $V(f(x, q) f(y, q)) \geq \min \{V(f(x$, q) $), V(f(y, q))\}$. For $x$ in $G$ and $q$ in $Q, V\left([f(x, q)]^{-1}\right)=V\left(f\left(x^{-}\right.\right.$ $\left.\left.{ }^{1}, q\right)\right) \geq A\left(x^{-1}, q\right) \geq A(x, q)$ which implies that $V\left([f(x, q)]^{-1}\right) \geq$ $V(f(x, q)$ ), for $x$ in $G$ and $q$ in $Q$. Hence $V$ is a $Q$-fuzzy subgroup of $\mathrm{G}^{\prime}$.
Proposition: Let ( $\mathrm{G}, \cdot \cdot$ ) and ( $\mathrm{G}^{\prime}, \cdot$ ) be any two groups and Q be a non-empty set. The Q-antihomomorphic pre-image of a Qfuzzy subgroup of $\mathrm{G}^{\prime}$ is a Q -fuzzy subgroup of G .
Proof: Let $(\mathrm{G}, \cdot)$ and $\left(\mathrm{G}^{\prime}, \cdot\right)$ be any two groups and Q be a set and $f: G x Q \rightarrow G^{\prime} x Q$ be a $Q$-antihomomorphism. That is $f(x y, q)$ $=f(y, q) f(x, q)$, for all $x$ and $y$ in $G$ and $q$ in $Q$. Let $V=f(A)$, where $V$ is a $Q$-fuzzy subgroup of $G^{\prime}$. We have to prove that $A$ is a Q-fuzzy subgroup of G. Let $x$ and $y$ in $G$ and $q$ in $Q$.
Now, $A(x y, q)=V(f(x y, q))=V(f(y, q) f(x, q)) \geq \min \{V(f(x$, q) $), V(f(y, q))\}=\min \{A(x, q), A(y, q)\}$ which implies that $A(x y, q) \geq \min \{A(x, q), A(y, q)\}$. And, $A\left(x^{-1}, q\right)=V\left(f\left(x^{-1}, q\right)\right)$ $=V\left([f(x, q)]^{-1}\right) \geq V(f(x, q))=A(x, q)$ which implies that $A\left(x^{-}\right.$ $\left.{ }^{1}, q\right) \geq A(x, q)$, for $x$ in $G$ and $q$ in $Q$. Hence $A$ is a Q-fuzzy subgroup of a group G.
